

VANTRUNK

EXTREME CABLE MANAGEMENT

PRODUCT GUIDE

ENGINEERED FOR EXTREME ENVIRONMENTS

WELCOME TO THE **VANTRUNK** PRODUCT GUIDE

With our extensive range of trusted products, evolved Rapid Installation Systems and new user-friendly 3D visuals we can help you to find the solutions you need.

With over 50 years experience of pioneering solutions in the toughest global environments, Vantrunk is renowned for its design and manufacture of cable management solutions that embody technical excellence and quality that are Engineered for Extreme Environments.

CABLE LADDER SYSTEM

The Speedway Cable Ladder System represents a major advance in cable ladder design, providing faster & easier installation, greater cable fill capacity and total flexibility.

1

Cable Ladder

CABLE TRAY SYSTEM

A full range of perforated Cable Trays manufactured to the highest standards, offering time saving and adaptable designs, practical slot patterns and versatile accessories.

2

Cable Tray

STEEL FRAMING SYSTEM

The Intelok Steel Framing System is a strong, easy to erect support system, ideal for supporting Vantrunk Cable Tray, cable ladders, trunking, pipes and ducting.

3

Steel Framing

UNIVERSAL MOUNTING FRAME SYSTEM

Universal mounting frame system for electrical equipment offering speed and flexibility of installation, available with a variety of accessories and bespoke options to suit any requirement.

4

Mounting Frame

FIXINGS

Cable Management installations often require a wide range of fixings. Vantrunk carry a vast range of these items to ensure that installers have a reliable 'single source' supply of components to meet their site requirements.

COMPANY PROFILE

Vantrunk is an internationally renowned manufacturer of engineered cable management products and associated support systems which are suitable for installation in the most extreme of environments. It's trusted and innovative solutions have been serving the Global Energy, Oil and Gas and Industrial Processing sector for over 50 years. Throughout this time Vantrunk has established itself as a leader in the development of proven and innovative cable management solutions engineered to thrive in extreme environments.

Our Cheshire, UK Production Site is purpose built for the manufacture of cable management solutions; it includes a 9290m² manufacturing and warehousing facility and an additional 6500m² marshalling and storage area which is ideal for consolidating and packing major project bulk materials. As the specialist division of the Unitrunk Group, the company has significantly increased its capacity and expertise through the utilisation of Unitrunk's 9300m² manufacturing facility in Northern Ireland.

At Vantrunk we believe that a manufacturing company must continuously invest to remain competitive in today's global market place. In recent year's substantial strategic investment has been made at both facilities updating the company's process lines using high specification machinery incorporating industry leading technology to ensure that product quality and delivery are consistently high.

ENGINEERED FOR **EXTREME** ENVIRONMENTS

In the toughest environments on earth engineers rely upon the tried and tested.

Knowing that you can depend on your Cable Management System is a key requirement for international Oil and Gas and industrial processing projects given the diverse and challenging geographical locations involved.

It is in these environments that you will find Vantrunk with our wealth of experience in providing both industrial onshore and offshore cable management systems that will meet the demands of even the harshest of environments.

Vantrunk's Extreme Cable Management solutions have been designed to stand up to a variety of extreme natural climatic and environmental conditions affecting corrosion, temperature variation and seismic elements.

Developers and engineers alike rely on Vantrunk to provide proven cable management solutions that have been Engineered For Extreme Environments, such as:

- **Arctic Circle @ -50C**
- **Desert conditions in the Middle East & North Africa @ +50c**
- **Category 5 Hurricane proof installation in Western Australia**
- **Areas of combined high salinity and humidity**

GLOBAL EXPERTISE

We believe that excellent working relationships are important for our business to develop and grow, this is why as your partner we are committed to adding value with the highest levels of service, support and innovative range of standard and bespoke cable management solutions.

Operators, engineers and design houses want to deal with companies that understand the challenge of operating in a global marketplace, from consolidating and shipping vast quantities of materials around the world to providing information to product inspectors and having the know how to complete the detailed documents required to support international shipments.

Thanks to our worldwide network of partners in key strategic locations including Australia, Azerbaijan, Brazil, Denmark, Kazakhstan, Korea, Netherlands, Oman, Qatar, Singapore, UAE and USA we deliver proven cable management solutions engineered for extreme environments, on time to major projects located around the world.

INTERNATIONAL PARTNERS

Partner Countries

Australia, Holland, Denmark, UAE, Oman, Qatar, Brazil, USA, Korea, Ireland, Singapore & The UK.

BEST PRACTICE

As a business committed to corporate responsible practices and continual improvement, Vantrunk is always exploring new horizons, going deeper, working harder and intelligently evolving its operations for the benefit of its clients and the sector.

Sustainability

At Vantrunk, we work hard to ensure our ability to operate safely and responsibly wherever we do business.

Our approach to sustainability covers issues relating to the environment and project life cycle.

As an organisation we incorporate the lessons learned in these areas into our management processes and practices applicable to our global business.

Environment

As a manufacturing business we take every care to minimise scrap and to maximise material usage and with the investment in energy efficient machinery and manufacturing techniques to reduce our impact on the environment.

Project Life Cycle

As an organisation working in a global market we ensure an approach that is sensitive to our responsibilities throughout the life cycle of a project - from the beginning to the end of our operations.

Development of the Vantrunk range of Cable Management Systems is approached with sustainability at its core. Through innovative solutions such as the Speedlok Cover System and Integral Coupler, Vantrunk aims to reduce installation times wherever possible and with a wide range of materials and finishes ensure that products thrive throughout the lifetime of projects in some of the harshest environments on Earth.

HEALTH & SAFETY

Vantrunk employ a full time Group Health & Safety Officer who reports directly to the Board of Directors. Further to this, Vantrunk have a dedicated team of H&S champions who hold monthly meetings to monitor and discuss H&S related issues.

Our statement of general policy:

- To comply with all applicable current health & safety legislation, ACOPs & guidance
- To provide adequate control of the Health & Safety risks arising from our work activities;
- To consult with our employees on matters affecting their health & safety;
- To provide and maintain safe plant and equipment;
- To ensure safe handling and use of substances;

- To provide adequate facilities for the welfare of the employees;
- To provide information, instruction and supervision for employees;
- To ensure that all employees are competent to do their tasks, and to give them all required / necessary training;
- To prevent accidents and cases of work-related ill health;
- To maintain safe & healthy working conditions;
- To review and revise this policy as necessary at regular intervals.
- To be committed to continual improvement of health & safety performance

We believe that one of the major functions is the prevention of accidents and ill health and we do not wish our employees or any other person to suffer as a result of our

activities or work processes. To this end we endeavour to comply with all statutory and moral requirements, codes of practice, best guidance and work methods.

The detailed policy of which this document is the general statement is the base plan on which all health & safety procedures, instructions, training, supervision and review & assessment, is founded.

It is also recognised that where we produce articles for use at work, we have a duty to ensure the health & safety of those who use them and make available all the required information for their health & safety.

Steve Davies
Managing Director

VANTRUNK

QUALITY & STRENGTH YOU CAN TRUST

We want our customers to have confidence in our products, our long term accreditation and compliance with ISO 9001 underscores this confidence.

We are members of the British Electrotechnical and Allied Manufacturers Association (BEAMA), the Energies Industry Council (EIC) and The Welding Institute and we are registered with FPAL and Achilles JQS. Vantrunk is represented on the IEC and European Standards cable management committees through its membership of BEAMA.

Memberships

Quality Mark: Products & Materials

We work hard to make sure our entire range is safe, reliable and manufactured to exceed all relevant quality standards

International Standards and Specifications

BS EN 10111:2008

Continuously hot rolled low carbon steel sheet and strip for cold forming. Technical delivery conditions

BS EN 10130:2006

Cold-rolled low-carbon steel flat products for cold forming. Technical delivery conditions

BS EN 10025-2:2004

Hot rolled products of structural steels. Technical delivery conditions for non-alloy structural steels

BS EN 10149-2:2013

Specification for hot-rolled flat products made of high yield strength steels for cold forming. Delivery conditions for thermo mechanically rolled steels

BS IEC 61892-6:2013

Mobile and fixed offshore units. Electrical installations. Installation

BS EN 10025-5:2004

Hot rolled products of structural steels. Technical delivery conditions for structural steels with improved atmospheric corrosion resistance

BS EN 10088-2:2014

Stainless steels. Technical delivery conditions for sheet/plate and strip of corrosion resisting steels for general purposes

BS EN 1461:2009

Hot dip galvanised coatings on fabricated iron and steel articles. Specifications and test methods

BS EN 10346:2015

Continuously hot-dip coated steel flat products. Technical delivery conditions

BS EN 61537:2007

Cable Tray systems and cable ladder systems

NEMA VE 1 2009

Metal Cable Tray Systems

BS 6946:1988

Specification for metal channel cable support systems for electrical installations

RUNGS

Rungs are alternately inverted to allow flexibility of cable restraint and suspension of equipment from underside.

SLOTTED SIDEWALLS

Fully slotted sidewalls which enables faster installation and reduces weight. Sidewall slots are located close to the centre line of the profile, therefore eliminating any weakness brought about when the slots are located near the base of the sidewall.

COUPLING

Unique slotted sidewalls and coupler design allows universal coupling without the need for onsite drilling on cut lengths. The Speedway profile also improves coupling by minimising slip at the joint.

LENGTHS

Available in 3m lengths as standard and in 6m Lengths as an option, which can provide a reduction in the number of supports & couplers required therefore reducing overall installation costs.

SPEEDWAY PROFILE

Unique profile featuring an offset web that:

- Maximises strength by acting similar to an I-Section
- Increases stability under loading
- Increases internal loading area by up to 7.5%
- Can reduce the number of supports required

INNOVATION DEPARTMENT

Continual investment in research and development has kept Vantrunk at the forefront of industry innovation throughout our history...

...placing us in the unique position to observe and influence industry requirements such as the operational lifetime of cable management systems.

As an organisation we provide more than just a product – we provide support for operators, engineers and design houses as they contend with the challenge of operating in a global marketplace.

The Team

Vantrunk's Innovation Department is a dynamic and forward thinking team of cable management professionals with over 100 years of combined cable containment, engineering and commercial experience.

As an authority in extreme cable management solutions Vantrunk actively contributes to the industry with key team members sitting on both the IEC and BEAMA cable management committees.

In line with our commitment to continual improvement for the benefit of our customers and the sector, Vantrunk contributed to the creation of the advisory regulations and guides for Cable Management in association with BEAMA – titled: Best Practice Guide to Cable Ladder and Cable Tray Systems - Channel support Systems and other Associated Supports. Please contact the Vantrunk sales team to obtain a copy of this very informative document.

Team skills include:

- **Technical specification**
- **Standards & legislation**
- **Client relationship**
- **Production**
- **Technical design**
- **CAD development**
- **Prototyping**
- **Testing**

THE PROCESS

Through a focus on customer needs and the development of in-depth knowledge of their requirements and expectations, Vantrunk's dedicated Innovation Team are continually researching and adopting cutting edge finishes & materials, manufacturing techniques and design solutions.

As a team we rise to challenges and follow a structured innovation and development methodology, including version control for research, field-testing and proof of concept procedures & technologies such as 3D printing that allows us to take a holistic and thorough approach to R&D.

The Services

At Vantrunk, we offer a range of internationally renowned core cable management services and engineered systems. With nearly 50 years of industry experience we have honed our ability to innovate and deliver specialist cable management solutions that are tailored to meet

the clients needs across the globe with solutions engineered for extreme environments

Services include:

- **Bespoke cable management solutions**
- **Product development**
- **Specialist environments**

The Product

Through years of development and careful product maturing, Vantrunk has evolved its trusted systems to cater for the progressive requirements of the international marketplace, providing an extended choice of safe and

time-saving innovations designed to complement our core product systems, including:

- **RIS – Universality for Rapid Installation Systems**
- **QF – Quick Fit, time and cost saving assemblies**
- **Speedlok – Secure, safe and fast cable ladder assemblies**
- **Systemization – Flexibility and totality of core cable management products**
- **VXS - Vantrunk Extreme Steel**

FACILITIES

Our purpose built 10,000m² production facility includes a manufacturing and warehousing facility and an additional marshalling and storage area ideal for major projects. Our resources and facilities also extend to include Unitrunk's 9300m² manufacturing facility in Northern Ireland. Both sites are equipped with state of the art industrial production and processing technology.

Facilities include:

- R&D
- On site testing to industry standards
- Measurement
- Cutting edge production equipment
- Standards conformance

Please consult our Innovative Design Solutions section for more bespoke products.

RAPID INSTALLATION SYSTEMS

You can slash the cost and time of installation by looking for our RIS logo. RIS, or Rapid Installation Systems, are designed by Vantrunk to make your life easier and provide substantial project cost savings. Innovative solutions such as the Speedlok Integral Coupler and IntelokQF brackets are part of the Rapid Installations System and these fast-fitting products let you complete jobs quicker than ever before.

You'll save time on installation, you'll save money on labour costs, and you'll be ready to start your next job well ahead of schedule. And you'll never have to worry about quality – RIS products are engineered to the same exceptional standards as all Vantrunk products.

LOK DOWN WITH THE INTEGRAL COUPLER

SPEEDLOK INTEGRAL COUPLER FEATURES

All Speedway fittings are manufactured with the Speedlok Integral Coupler as standard; this represents a major advance in modern cable management design. The Speedlok Integral Couplers reduce:

- The number of fixings required to connect the ladder and fitting, in turn reducing the ladder to fitting connection by 67%.
- And therefore the overall installation time, weight and cost.

VANTRUNK
SPEEDLOK
QUICKFIT CABLE LADDER

For more information on the Speedlok Integral Coupler visit vantrunk.com

PLANT DESIGN INTEGRATION

Vantrunk are fully committed in supporting engineers and designers to achieve maximum productivity and capability on all types of project, from the smallest brownfield upgrade to new build projects of unlimited size and complexity.

An example of this is the integration of our products in the latest plant design software such as AVEVA PDMS & Everything3D and Hexagon PPM Smart 3D (formally Intergraph SmartPlant 3D).

PDMS & E3D

To Access:

Included as standard in
PDMS 12.0.SP6 and E3D 1.1

Smart 3D

To Access:

Available to download from
Vantrunk.com

The benefits of using our product integrations are:

- **Clear identification of the weight of a Cable Management System**
- **Ensures accurate routing of cables and cable management**
- **Clash detection and integrity checking ensure higher quality designs and helps avoid costly on-site rework**
- **Full part code compatibility with Vantrunk's ordering system**
- **Drawings, reports and Bills of Materials (BoMs) are produced directly from the design software, ensuring their accuracy and compatibility with Vantrunk's product**

“Vantrunk cable management catalogues are fully integrated into the AVEVA PDMS modelling system.

Using the Vantrunk catalogue in the Aveva PDMS modelling system, during the Design phase, will prevent clashes with all items that have been modelled, thus significantly reducing any re-work during the construction phase.

The catalogue has an accuracy of modelling down to 1mm and the precise design produced enables enhanced scheduling and forward planning, the accurate production of MTO's and Isometric drawings for construction.”

Mr. Gary Hastings,
Lead Electrical Design Engineer

For more information on using Vantrunk's product within plant design software please contact our Technical Team.

HOW TO USE

The Vantrunk Product Guide has been technically designed to deliver ease of use, clarity and speed of reference using the guide points below:

User-friendly tab navigation

Quickly flick to your preferred product sections using the colour coded product tabs and sub sections.

How to order guides

Product ordering is explained at the start of Speedway, Cable Tray and Intelok product sections.

Product Information

Each product is listed with a reference code supported by a table of variable dimensions, insert relevant values for the Δ and \circ icons where necessary.

For any variations not shown please contact our technical team via eddy@vantrunk.co.uk or call +44(0)1928 564211.

Fixings

Supplied with:

**FIXING
SETS x16**

A fixing set can include, a bolt, washer and nut and will vary depending on the application.

Finishes & Materials

Each product section includes a selection of the available finishes and materials.

Index All products listed alphabetically for ease of reference.

FINISHES & MATERIALS

Vantrunk offers a wide selection of Finishes and Materials to suit a project's loading, corrosion resistance and environmental requirements.

ENVIRONMENT CATEGORIES

| Category | Corrosivity | Typical Environment | |
|----------|-------------|---------------------|--|
| C2 | Low | Indoor | <ul style="list-style-type: none"> Unheated spaces with varying temperature and relative humidity. Low frequency of condensation and low pollution, storage, sport halls |
| | | Outdoor | <ul style="list-style-type: none"> Temperate zone, atmospheric environment with low pollution (SO₂: < 5 µg/m³), e.g. rural areas, small towns Dry or cold zone, atmospheric environment with short time of wetness, e.g. deserts, subarctic areas |
| C3 | Medium | Indoor | <ul style="list-style-type: none"> Spaces with moderate frequency of condensation and moderate pollution from production process, e.g. food-processing plants, laundries, breweries, dairies |
| | | Outdoor | <ul style="list-style-type: none"> Temperate zone, atmospheric environment with medium pollution (SO₂: 5 µg/m³ to 30 µg/m³) or some effect Of chlorides, e.g. urban areas, coastal areas with low deposition Of chlorides Subtropical and tropical zone, atmosphere with low pollution |
| C4 | High | Indoor | <ul style="list-style-type: none"> Spaces with high frequency Of condensation and high pollution from production process, e.g. industrial processing plants, swimming pools |
| | | Outdoor | <ul style="list-style-type: none"> Temperate zone, atmospheric environment with high pollution (SO₂: 30 µg/m³ to 90 µg/m³) or substantial effect Of chlorides, e.g. polluted urban areas, industrial areas, coastal areas without spray Of salt water or, exposure to strong effect of de-icing salts Subtropical and tropical zone, atmosphere with medium pollution |
| C5 | Very High | Indoor | <ul style="list-style-type: none"> Spaces with very high frequency Of condensation and/or with high pollution from production process, e.g. mines, caverns for industrial purposes, unventilated sheds in subtropical and tropical zones |
| | | Outdoor | <ul style="list-style-type: none"> Temperate and subtropical zone, atmospheric environment with very high pollution (SO₂: 90 µg/m³ to 250 µg/m³) and/or significant effect Of chlorides, e.g. industrial areas, coastal areas, sheltered positions on coastline |
| CX | Extreme | Indoor | <ul style="list-style-type: none"> Spaces with almost permanent condensation or extensive periods Of exposure to extreme humidity effects and/or with high pollution from production process, e.g. unventilated sheds in humid tropical zones with penetration of outdoor pollution including airborne chlorides and corrosion-stimulating particulate matter |
| | | Outdoor | <ul style="list-style-type: none"> Subtropical and tropical zone (very high time Of wetness), atmospheric environment with very high SO₂ pollution (higher than 250 µg/m³) including accompanying and production factors and/or strong effect of chlorides, e.g. extreme industrial areas, coastal and offshore areas, occasional contact with salt spray |

Hot Dipped Galvanised Structural Steel

BS EN 10025-2:2004

Minimum Average Coating Thickness = 85 µm

Deep Galvanised Structural Steel

BS EN 10025-2

Minimum Average Coating Thickness = 120 µm

Hot Dipped Galvanised Carbon Steel

BS EN 1011:2008 / BS EN 10130:2006

Minimum Average Coating Thickness = 55 µm

Marine Grade Stainless Steel

BS EN 1088-2:2005

Hot Dipped Galvanised Structural Steel

BS EN 10025-2:2004

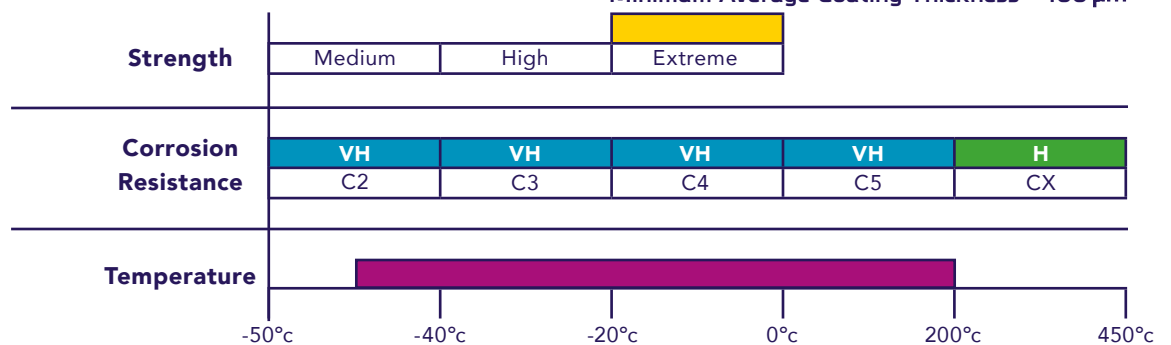

Minimum Average Coating Thickness = 55 µm

Deep Galvanised Silicon Rich Structural Steel

BS EN 10025-5:2004

Minimum Average Coating Thickness = 160 µm

Pre Galvanised Structural Steel

BS EN 10326:2004

LIFE EXPECTANCY CODE

L = Low - 2 to 5 Years

M = Medium - 5 to 10 Years

H = High - 10 to 20 Years

VH = Very High - Above 20 Years

Notes:

- Information from BS EN ISO 9223
- Hot Dip Galvanising carried out to BS EN 1461
- The operating temperatures stated in the table have been ascertained by using certified values as well as carrying out independent Charpy testing
- For more information on Finishes, Materials and Corrosion please consult the Engineering Data Section at the back of the Product Guide

HOW TO ORDER

CODE SYSTEM EXPLAINED

The information given on these pages should be used as a guide when ordering Speedway Cable Ladder, Fittings and Accessories. For more detailed information and examples refer to the relevant page within the catalogue.

Speedway Straight Ladder

| System Type | Ladder Length | Width | Finish & Material | Sidewall Gauge | Rung Gauge |
|-------------|---------------|-------|-------------------|----------------|------------|
|-------------|---------------|-------|-------------------|----------------|------------|

eg. SW6 – SL3 – 300 – GY – 2.0W – 2.0T

Speedway® SW6, Straight Ladder, 3000mm Long, 300mm Wide, Structural Steel, Hot Dip Galvanised - 2.0mm Wall, 2.0mm Rung

Speedway Fittings

| System Type | Fitting Type | Width | Radius | Finish & Material | Sidewall Gauge | Rung Gauge |
|-------------|--------------|-------|--------|-------------------|----------------|------------|
|-------------|--------------|-------|--------|-------------------|----------------|------------|

eg. SW5 – FE30 – 900 – 600R – SS – 1.5W – 1.5T

Speedway® SW5 Flat Elbow 30°, 900mm Width, 600mm Radius, Grade 1.4404 (316L) Stainless Steel, P&P - 1.5mm Wall, 1.5mm Rung

Speedway Couplers

| System Type | Coupler Type | Finish & Material |
|-------------|--------------|-------------------|
|-------------|--------------|-------------------|

eg. SW6 – CS – GX

Speedway® SW6, Straight Coupler, Silicon Rich Structural Steel, Deep Hot Dip Galvanised

Speedway Accessories

| System Type | Accessory Type | Accessory Length | Finish & Material | Gauge |
|-------------|----------------|------------------|-------------------|-------|
|-------------|----------------|------------------|-------------------|-------|

eg. SW6 – DIV – SL1.5 – GA – 1.2

Speedway® SW6, Straight Ladder Divider, 1500mm Long, Mild Steel, Hot Dip Galvanised

Speedway Straight Ladder Covers

| System Type | Cover Type | Cover Length | Width | Finish & Material | Gauge |
|-------------|------------|--------------|-------|-------------------|-------|
|-------------|------------|--------------|-------|-------------------|-------|

eg. SW – CC – SL1.5 – 300 – GA – 1.2

Speedway® SW Closed Cover, Straight, 1500mm Long, 300mm Wide, Hot Dip Galvanised

Speedway Fitting Covers

| System Type | Cover Type | Fitting Type | Width | Radius | Finish & Material | Gauge |
|-------------|------------|--------------|-------|--------|-------------------|-------|
|-------------|------------|--------------|-------|--------|-------------------|-------|

eg. SW – CL – FE30 – 300 – 600R – SS – 1.0

Speedway® SW Louvered Cover, Flat Elbow 30°, 300mm Width, 600mm Radius, Grade 1.4404 (316L) Stainless

System Type (▲)

Further Guidance

Please contact our Sales Team for further advice and guidance on the correct ordering details for the full range of Speedway cable ladder, fittings and accessories.

UNIQUELY VANTRUNK

RUNGS

Rungs are alternately inverted to allow flexibility of cable restraint and suspension of equipment from underside.

SLOTTED SIDEWALLS

Fully slotted sidewalls which enables faster installation and reduces weight. Sidewall slots are located close to the centre line of the profile, therefore eliminating any weakness brought about when the slots are located near the base of the sidewall.

DRAIN HOLES

Drain holes are included in the Rungs and the top and bottom flanges of the Sidewalls.

COUPLING

Unique slotted sidewalls and coupler design allows universal coupling without the need for onsite drilling on cut lengths. The Speedway profile also Improves coupling by minimising slip at the joint.

LENGTHS

Available in 3m lengths as standard and in 6m Lengths as an option, which can provide a reduction in the number of supports & couplers required thereby reducing overall installation costs.

SPEEDWAY PROFILE

Unique profile featuring an offset web that:

- Maximises strength by acting similar to an I-Section
- Increases stability under loading
- Increases internal loading area by up to 7.5%
- Can reduce the number of supports required

STRAIGHT LENGTHS

- Straight lengths of ladder are available in both 3m and 6m lengths to suit project requirements.
- Using 6m Straight Ladder reduces the number of structural supports and couplers that are required whilst maintaining a high loading performance. These reductions contribute to cutting overall project costs and weight.

COVERS

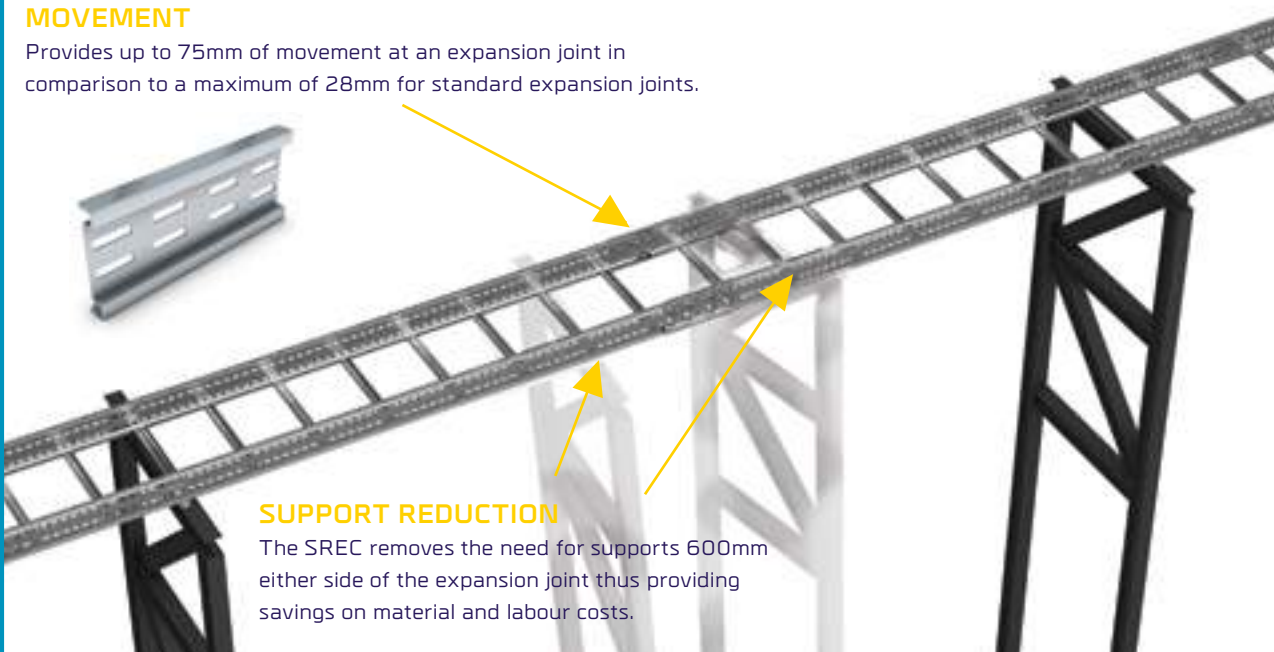

- Speedway covers are available in Peaked, Louvered and Closed (Non-Louvered)
- All Covers fit directly onto the cable ladder thus providing additional mechanical protection to cables whilst maintaining ventilation when required
- Speedway cover widths of 450mm and above come supplied complete with Bracing Bars to further enhance strength in high wind environments (including hurricane force winds) and to reduce potential damage from any on site temporary imposed loads

SUPPORT REDUCTION EXPANSION COUPLER

MOVEMENT

Provides up to 75mm of movement at an expansion joint in comparison to a maximum of 28mm for standard expansion joints.

SUPPORT REDUCTION

The SREC removes the need for supports 600mm either side of the expansion joint thus providing savings on material and labour costs.

STRAIGHT LADDER

Speedway Straight Cable Ladder is available in standard widths of 150mm, 300mm, 450mm, 600mm, 750mm and 900mm. Other widths from 100mm to 1500mm in 50mm increments are available to order. Ladders over 1050mm wide are only available in Heavy SW5 and Extra Heavy Duty SW6 systems.

Speedway Straight Cable Ladder is available in lengths of 3m and 6m. Unless otherwise specified 3m lengths are supplied as standard, 6m lengths are made to order.

All Speedway straight ladders are pre-punched with dedicated diamond earth bonding holes which facilitates earth continuity straps (thereby complying with European, IEC, and NEMA standards requirements) whilst maintaining a smooth cabling area through the use of the Vantrunk square shoulder round head bolt.

Speedway Cable Ladder sidewalls and rungs can be manufactured in either 1.5mm or 2.0mm material gauges. The supplied gauge combination is dependent

on the application and desired performance capabilities, please consult our Sales Team for further details.

Rung spacing on straight ladders is at 300mm centres. As standard the Speedway rung is orientated alternately inverted to allow for cable cleat spacing at 600mm centres. Other orientations such as rungs all facing up or all facing down are available to order.

The Speedway Cable Ladder system has been independently tested and certified in accordance to BS EN & IEC 61537 and NEMA 20C, please contact our Sales team for further details.

Speedway SW4 Cable Ladder

Speedway 4 (SW4) Medium Duty Cable Ladder is manufactured in 3.0m lengths as standard with 6.0m lengths to order. The cable ladder is available in standard widths of 150mm, 300mm, 450mm, 600mm, 750mm and 900mm, widths of 100mm up to 1050mm, in 50mm increments, are available to order. Rung spacing is 300mm as standard.

System Type: SW4

Speedway SW5 Cable Ladder

Speedway 5 (SW5) Heavy Duty Cable Ladder is manufactured in 3.0m lengths as standard with 6.0m lengths supplied to order. The cable ladder is available in standard widths of 150mm, 300mm, 450mm, 600mm, 750mm and 900mm, widths of 100mm up to 1500mm, in 50mm increments, are available to order. Rung spacing is 300mm as standard.

Speedway SW6 Cable Ladder

Speedway 6 (SW6) Extra Heavy Duty Cable Ladder is manufactured in 3.0m lengths as standard with 6.0m lengths supplied to order. The cable ladder is available in standard widths of 150mm, 300mm, 450mm, 600mm, 750mm and 900mm, widths of 100mm up to 1500mm, in 50mm increments, are available to order. FITTINGS

Vantrunk Speedway cable ladder fittings incorporate several features which enhance the systems ease of installation.

All Speedway fittings are manufactured with the Speedlok Integral Coupler, thereby removing the need for separate couplers and reducing the number of fixings required to connect the ladder and fitting and in turn reducing the ladder to fitting connection time by 67%. The substantial reduction in the number of fixings and reduction in the number of couplers required also helps to reduce top side weight in off-shore facilities.

As in the cable ladder side wall, the cable ladder fitting side wall has an offset central web to enhance stability when under load.

All radius sections in the Vantrunk Speedway range of fittings have a repeatable and true radius which eliminates the traditional "make it fit" approach during installation.

All Speedway fittings are pre-punched with dedicated diamond earth bonding holes which facilitates earth continuity straps (thereby complying with European, IEC, and NEMA standards requirements) whilst maintaining a smooth cabling area through the use of the Vantrunk square shoulder round head bolt.

Fitting to Fitting Coupler (FFC)

When joining one fitting to another to suit on-site installation requirements the use of a Fitting to Fitting Coupler (FFC) will be required. See Page 69 for further details.

Speedway Fittings

Speedway fittings are available in widths from 150mm to 900mm and in the case of Flat Elbows and Risers at angles of 30, 45, 60 and 90 degree as standard. Other widths between 100mm to 1500mm and radii, subject to cable ladder system type, are also available. The standard radii are 300mm, 450mm, 600mm, 750mm and 900mm.

All fittings are supplied with all necessary fixings for connecting fittings to straight ladder.

The rungs are orientated with the open face uppermost to suit the use of cleats and similar cable restraint devices. This allows compliance with current recommendations for cable restraint, especially where cables are used which have a high potential fault current level.

SPEEDLOK INTEGRAL COUPLER

RUNGS

Rungs on fittings are all located face up to allow fixing of short circuit restraint cleats thus maintaining a true radius when changing direction.

SPEEDLOK INTEGRAL COUPLER

Speedway fittings feature a Speedlok Integral Coupler that:

- Eliminates the need for a separate coupler when connecting fittings to straight lengths
- Reduces the ladder to fitting installation time by 67%
- Decreases weight of installations by using less material in the coupler and also less fixings.

Part of the Rapid Installation System (RIS)

FLAT ELBOWS

Flat Elbows (FE) are designed to create fixed angular coplanar connections between horizontal cable runs (cable ladder installed in horizontal plane) and between vertical cable runs (cable ladder installed in vertical plane).

The rungs in the Speedway Flat Elbows are located radially at either 0° or at 7½° incremental angles (or multiples thereof) and are positioned to give a maximum linear distance of no more than 465mm between adjacent rungs on adjacent Speedway Cable Ladder and Speedway Cable Ladder Fittings when measured along the outer radius.

ENGINEERED FOR EXTREME ENVIRONMENTS

GOLDEN EAGLE PROJECT

The Nexen-operated Golden Eagle project produced first oil on October 30, 2014. Upon completion, the project had expended 179 million hours worked. Located 70 km northeast of Aberdeen, Golden Eagle is the second largest oil discovery in the UK North Sea since Buzzard was discovered in 2001.

INSIDE & OUTSIDE RISERS

Inside Risers (IR) and Outside Risers (OR) are designed to create fixed angular non-coplanar connections between cable runs and can be used in both vertical and horizontal orientations.

Speedway Inside Risers (or vertical inside bends) create internal changes in direction; outside risers (or vertical outside bends) create external changes in direction. The rungs are located at the intersection of adjacent facets.

Speedway 30° Inside & Outside Risers

Fitting Type: IR30 / OR30

ARTICULATED RISERS

Speedway Articulated Risers (AR) are designed to create adjustable angular non-coplanar connections between Speedway Cable runs.

Speedway Articulated Risers consist of pre-assembled units, each comprising of end connectors and one or more middle sections which can be adjusted on site to suit specific installation requirements.

The articulated riser has a number of advantages over fixed risers:

- Universal application – there is no requirement to select both inside and outside risers.
- Any number of middle sections can be added to achieve very large radii and allow strong support along an undulating cable route.
- The pattern of fixing holes allows for infinite angle and radius adjustment.
- Can be used to form a bridge, an 'S' bend, or an offset to suit installation routing challenges on site.

- The end connectors are vertical adjustable couplers and, by using the easi-bend slots, can be adjusted on site to create combined horizontal & vertical offset connections, or combined riser-tee connections onto the side wall of a main cable ladder run.

Speedway Articulated Risers are available in widths from 150mm to 1050mm as standard. Other widths of 100mm up to 1500mm, in 50mm increments, are available to order.

Intended to be locked into place after installation, the Speedway Articulated Riser is not designed to allow for relative movement between adjacent cable runs.

When joining one fitting to another to suit on site installation requirements the use of a Fitting to Fitting Coupler (FFC) will be required. Please refer to Page 69 for further details.

Articulated Risers

Fitting Type: AR (See table)

Angle & Section Details

The following table shows the combination of angle and radius which can be formed for a number of differing middle sections. The radius for both the inside and outside articulated riser is measured relative to the rung position.

| Part Number | Angle | No. of Sections | Radius R mm | | | |

EQUAL & UNEQUAL TEES

Equal Tees (ET) and Unequal Tees (UT) are designed to create perpendicular coplanar connections between horizontal cable runs (ladder installed in horizontal plane) and between vertical cable runs (ladder installed in vertical plane).

Tees have a primary or main width (Wm) and a secondary or branch width (Wb). Tees with the same primary and secondary widths are called equal tees. Tees with differing main and branch widths are called unequal tees.

The rungs in the Speedway Tees are spaced to give a maximum linear distance of no more than 465mm between adjacent rungs/rungs on adjacent ladder and fittings.

VANTRUNK

ENGINEERED FOR EXTREME ENVIRONMENTS

GORGON LNG

Gorgon is a story of energy, the environment as well as technology and expertise. It is globally one of the largest natural gas projects ever undertaken, in a challenging and remote location, and the largest single-resource development in Australia's history.

LOCATION

WESTERN AUSTRALIA
Between 130 - 220km
off the northwest coast.

CLIENT

Kellogg Joint Venture | Gorgon

\$54bn
OVERALL COST
OF PROJECT

FACT 1

15.6 million
tonne per annum (MTPA)
liquefied natural gas plant

FACT 2

2.1 km
long loading jetty

FACT 3

12.9 tcf gas
in water depth of
220m

FACT 4

Carbon Capture
Dupuy reservoir

2,500m
below Barrow island

EQUAL CROSSES

Equal Crosses (EC) are designed to create intersecting coplanar connections between horizontal cable runs (ladder installed in horizontal plane) and between vertical cable runs (ladder installed in vertical plane).

Equal Crosses, where the branches have identical widths, are supplied as standard. Consult our Sales Team on the availability of non-standard crosses where differing branch widths and differing radii are required to suit specific installation requirements.

REDUCERS - STRAIGHT, LEFT & RIGHT

Speedway Reducers are used to create coplanar reductions in widths between adjoining straight ladders and between straight ladders and fittings of the same ladder type, fulfilling the same role as short and long adjustable couplers but using a purpose made fitting capable of self-support as part of a cable run.

Speedway Straight Reducers (RS reducer straight) are used to create a concentric reduction, having an equal width reduction along both sides. Left hand reducers (RL reducer left) and right hand reducers (RR reducer right) are used to create offset reductions to suit particular installation requirements. Left hand reducers have the width reduction on the left when viewed from the primary width. Right hand reducers have the width reduction on the right when viewed from the primary width.

The Speedway Reducer has an overall length of 500mm and feature two rungs as standard irrespective of ladder type and width reduction.

COUPLERS

The Speedway Coupling system has been designed to reduce the potential for slip to occur between connected components, a common problem for cable ladder systems when under load.

The slot pattern in the ladder sides can be combined with the slot pattern in the couplers and integral couplers to create a pattern of squares; these square patterns can also be formed irrespective of where straight ladders are cut to length to suit site installation requirements. The specially designed Vantrunk square shouldered bolt interlocks into this pattern of squares to create a slip-resistant connection.

The Speedway Coupler has a profile which exactly matches the unique profile of the Speedway Ladder (& Fitting side walls) to give a high performance connection which securely holds the connected components together.

All standard Speedway Couplers are supplied singly and come complete with all necessary fixings. i.e. specially designed domed head M10X20 cup square bolts (eliminating sharp edges) and M10 Serrated Flange Nuts as standard.

with 8 fixings per coupler

Horizontal Adjustable Couplers

Speedway Horizontal Adjustable Couplers (HAC's) are used to join straight ladder and fittings where these need to be connected at offset angles in the same horizontal or vertical plane. When connecting a HAC to a cable ladder fitting please connect via a Fitting to Fitting Coupler (FFC), turn to Page 69 for details.

Speedway Horizontal Adjustable Couplers are supplied singly and come complete with all necessary ladder fixing sets.

The Speedway Horizontal Adjustable Coupler is supplied flat and has easi-bend slots which allow the coupler to be bent on site to any angle to connect two cable ladder runs to form 'T' & 'Y' intersections.

Coupler Type: HAC

Part Number: SW△-HAC-○

Horizontal adjustable couplers

with 8 fixings per coupler

Vertical Adjustable Couplers

Speedway Vertical Adjustable couplers (VAC) are used to join straight ladder and fittings where these need to be connected at offset angles when these lie in different planes. When connecting a VAC to a cable ladder fitting please connect via a Fitting to Fitting Coupler (FFC), turn to Page 69 for details.

Speedway Vertical Adjustable couplers are supplied singly and come complete with all necessary ladder fixing sets. Each vertical adjustable coupler comprises of two half plates complete with all necessary pivot fixings.

The arrangement of the pivot holes and elongated slots allows for infinite angular adjustment to suit specific site requirements. The vertical adjustable coupler features easi-bend slots which allow the couplers to be adjusted on site to create combined horizontal & vertical offset connections, ladder connections onto the side wall of a main run to form tees, or straight ladder & fitting connections directly to a floor or wall.

| Coupler Type: VAC | Part Number: SW△-VAC-○ |

Horizontal Hinged Couplers

Speedway Horizontal Hinged Couplers (HHC's) are offered as an alternative to the HAC. Speedway Horizontal Hinged Couplers are supplied singly and come complete with all necessary ladder fixing sets.

The Speedway Horizontal Hinged Coupler is supplied as an assembly allowing the coupler to be hinged to any angle to connect two cable ladder runs to form 'T' & 'Y' intersections.

Coupler Type: HHC

Part Number: SW△-HHC-○

Short & Long Adjustable Couplers

Speedway Short and Long Adjustable Couplers are used to create custom reductions in width during installation & to convert equal tees and crosses into unequal tees and crosses when used with a Fitting to Fitting Coupler (FFC).

Speedway Short and Long Adjustable Couplers are supplied singly and come complete with all necessary ladder fixing sets. Each adjustable coupler has 50mm long segments with easibend slots which allow the couplers to be adjusted on site to suit specific installation requirements.

Short adjustable couplers allow reductions of up to & including 150mm per coupler. Long adjustable couplers allow reductions of up to & including 300mm per coupler.

A single short or long adjustable coupler can be used in conjunction with a standard coupler to create an offset connection between two ladders or fittings of differing widths. For concentric reductions, two short or long adjustable couplers are required.

Coupler Type: SAC & LAC

Part Number: SW△-LAC-○

Fitting to Fitting Coupler

Speedway Fitting to Fitting Coupler (FFC) facilitates the joining of two abutting cable ladder fittings with Speedlok Integral Couplers. The fitting to fitting coupler is also used when turning an equal cross into an unequal Cross.

The Fitting to Fitting Coupler is based on the traditional Speedway Cable Ladder profile which is manufactured to a length of 200mm. The FFC is available across the Speedway product range in SW4, SW5 and SW6. To allow for two cable ladder fittings to be secured each FFC has 5 rows of slots, containing an 11mm hole in the middle row to allow fixing of an Earth Bonding Strap (ESB-01)

To join two ladder fittings, first loose fit the FFC to one of the abutting fittings. Once the FFC is in place it will allow the secondary fitting to be positioned and fixed easily, tighten the fixings allowing the integral couplers to clamp onto the FFC profile thus providing a secure joining mechanism between the fittings.

An FFC will also be required when turning an Equal Cross (EC) into an Unequal Cross using a Reducer. Firstly the FFC should be secured loosely to the Cross, when both FFCs are in place secure the reducer. When all fixing locations are tightened the reducer will provide an immediate reduction to the equal cross. Please refer to Equal Crosses for more details.

The Fitting to Fitting coupler is supplied singly. To allow for full mechanical and environmental protection of cables, a Fitting to Fitting Cover will be required.

Coupler Type: FFC

Expansion Coupler

Speedway Expansion Couplers (EXP) are recommended for those installations where the maximum and minimum temperatures are such that the expansion and contraction of the cable ladder installation is a consideration.

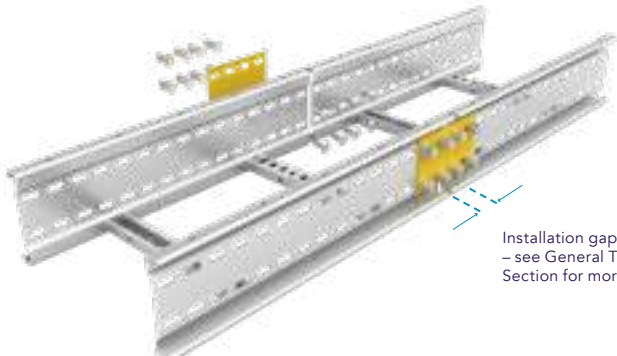

Each Expansion Coupler is designed to allow for a maximum movement of 28mm. Speedway expansion couplers are supplied singly and come complete with all necessary ladder fixings (8 fixings supplied with each coupler).

The Expansion Coupler should not be installed without a support either side of the expansion joint within 600mm.

Specific recommendations covering the spacing of expansion couplers and the setting gap at the time of installation are given in the General Technical Section.

Coupler Type: EXP
Part Number: SW△-EXP-○

Support Reduction Expansion Coupler

Speedway Support Reduction Expansion Couplers (SREC) are recommended for those installations where the maximum and minimum temperatures are such that the expansion and contraction of the cable ladder installation is a consideration and where it is not possible to provide support within 600mm of the expansion joint.

Capable of carrying the full load of the Speedway Cable Ladder at the expansion joint, each expansion coupler is designed to allow for a maximum movement of 75mm.

Speedway Support Reduction Expansion Couplers are supplied singly and come complete with all necessary ladder fixings (8 fixing sets per coupler).

Specific recommendations covering the spacing of expansion couplers and the setting gap at the time of installation are given in the General Technical Section of the catalogue.

ACCESSORIES

The Speedway Cable Ladder System is complemented by a range of accessories designed to aid installation and to add additional functionality & flexibility to the Speedway Cable Ladder System.

From versatile fixing clamps and brackets to junction box mounting plates and instrumentation tubing clamp plates, the Vantrunk range of Speedway Accessories have been designed over many years to represent cost-effective & practical solutions in the real installation environment.

External Flange Clamp

The External Flange Clamp (EFC) forms a simple but effective means of connecting Speedway Cable Ladder and Fittings to the supporting structure.

Designed for use with either channel (BS 6946 strut type) or structural steelwork, the external flange clamp has an M10 clearance hole.

Forming a secure clamping attachment onto the bottom flange of the Speedway profile, the external

flange clamp can be used with all Speedway SW4, SW5, & SW6 cable ladder and fittings.

The External Flange Clamp is suitable for securing horizontal runs of Speedway Cable Ladder and Fittings in the horizontal plane.

External Flange Clamps are not suitable for supporting Speedway Cable Ladder installed as part of a vertical run.

Accessory Type: EFC

Part Number: SW-EFC-○

The following table gives the recommended fixing hole centres and general dimensions when using External Flange Clamps.

| Dimensions (mm) | | | |
|-----------------|----|------|-------|
| A | B | C | D |
| 44.5 | 56 | W+89 | W+116 |

Adaptable Fixing Bracket

The Speedway Adaptable Fixing Bracket (AFB) provides a bolted connection between the supporting structure and the Speedway Cable Ladder & Fittings.

The adaptable fixing bracket is recommended for use in supporting vertical runs of Speedway Cable Ladder and Fittings and for applications where the Speedway Cable Ladder is edge-mounted (i.e. installed in the vertical plane running horizontally).

The adaptable fixing bracket gives multiple fixing options for attaching and securing Speedway Cable Ladder and Fittings.

Forming a secure bolted connection into the lower row of slots, the adaptable fixing bracket is suitable for use with Speedway SW4, SW5, & SW6 Cable Ladder and Fittings.

For those applications where space is limited, the Adaptable Fixing Bracket can be fitted internally within the Speedway Cable Ladder. The unique design of the Adaptable Fixing Bracket is such that there is no decrease in the effective loading area of the cable ladder when installed in this manner.

The adaptable fixing bracket can also be used singularly or in pairs to suspend Speedway Cable Ladder from threaded rod. For Speedway SW4 & SW5 Cable Ladder, the adaptable fixing bracket forms a simple but effective end connector to walls and floors.

The adaptable fixing bracket is supplied with one ladder fixing as standard.

Accessory Type: AFB

Part Number: SW-AFB-○

Speedway Hold Down Bracket

The Speedway Hold Down Bracket (HDB) is a simple but effective means of securing Speedway Cable Ladder and Fittings to the supporting structure. The Hold Down Bracket has a single M10 clearance slot which allows for easy adjustment to suit predrilled fixing holes in the supporting structure. The Hold

Down Bracket is equally suited for installation on channel (BS 6946 strut type) or steelwork.

Hold Down Brackets are not suitable for supporting Speedway Cable Ladder installed as part of a vertical run.

Accessory Type: HDB

Part Number: SW△-HDB-○

Supplied in two parts, omit System Type e.g. SW-HDB-○

○ = Select a Finish & Material

The minimum thread length for the M10 fixing bolt is 22mm plus the thickness of the supporting steelwork. Refer to the table above for details of the fixing bolts.

Insulating Assemblies

A comprehensive range of nylon insulating assemblies are available to suit those installations where there is a requirement to provide electrical separation between the Speedway Cable Ladder System and the support structure.

A typical example is a stainless steel Speedway Cable Ladder System mounted on galvanised or painted steel supports.

The insulating assembly is based on nylon base pads, nylon bushes and nylon washers which, when used with the Speedway External Flange Clamp, the Speedway Adaptable Fixing Bracket, or the Speedway Hold Down Bracket totally encapsulate the fixings and provide an insulation barrier between the Speedway Cable Ladder System and the supporting structure.

M10 Nylon Bush

315AN01-##: Nylon Bush Length ## = Steel Thickness (mm)

The length of the nylon bush is equal to the thickness of the supporting steelwork (##). The nylon bush requires a 17mm diameter hole in the supporting steelwork.

M10 Fixing Bolt

The minimum thread length for the fixing bolt (□) is 22mm plus the thickness of the supporting steelwork(##). Refer to the table below for details of the fixing bolts.

| Part Number | Thread Length (□) | Description |
|-----------------|-------------------|---|
| M10x25-HS-SS-A4 | 25mm | M10 x 25 Hex Head Set Screw Stainless Steel |
| M10x30-HS-SS-A4 | 30mm | M10 x 30 Hex Head Set Screw Stainless Steel |
| M10x35-HS-SS-A4 | 35mm | M10 x 35 Hex Head Set Screw Stainless Steel |
| M10x40-HS-SS-A4 | 40mm | M10 x 40 Hex Head Set Screw Stainless Steel |

Insulating Assembly Components for External Flange Clamp (EFC)

| Part Number | Item | Description |
|------------------|------|---|
| M10x□-HS-SS-A4 | 1 | M10 Hex Head Set Screw Stainless Steel - Length = □ |
| M10-FW-SS-A4 | 2 | M10 Flat Washer Stainless Steel |
| SW-EFC-SS | 3A | Speedway External Flange Clamp Stainless Steel |
| PAD-66.5x50x4-NY | 4A | Nylon Pad (66.5 x 50 x 4mm) |
| BUSH-16x##-NY | 5 | Nylon Bush - Length = ## |
| M10-FW-NY | 6 | M10 Flat Washer Nylon |
| M10-HN-SS-A4 | 7 | M10 Hex Nut Stainless Steel |

For Example:

If the thickness of the Steelwork = 12mm
 The length of the Nylon Bush is also 12mm = 315AN01-12
 This means that the Minimum Thread Length of the Fixing Bolt = 22 + 12 = 34mm
 Rounding this figure up to the nearest standard bolt length of 35mm,
 the supplied bolt = SSM10x35HS
 If an AFB is to be used, order: SW-AFB-SS-INS12

Insulating Assembly Components for Adaptable Fixing Bracket (AFB)

Protective End Caps

Protective End Caps (PEC) are available for all Speedway profiles.

Manufactured in flexible yellow PVC material as standard, the protective end cap provides a visible and safe means of identifying & covering the open ends of Speedway Cable Ladder and Fittings.

Low smoke-zero halogen finish – contact our Technical Team for details.

Accessory Type: PEC

Protective end caps installed on a Speedway cable ladder

Speedway Mounting Plate

The Speedway Mounting Plate (SMP) provides a means of attaching junction boxes and other items to the speedway Cable Ladder System. Mounting plates are available to suit all Speedway Cable Ladder widths up to & including 900mm for attachment across the face of the cable ladder. The 300mm Speedway Mounting Plate (SW-SMP-300-#) can also be attached between rungs on all widths of Speedway Cable Ladder and can be mounted either within the cable space or below the cable ladder.

Alternative mounting plate designs can be made to order. Contact our Sales Team for more details.

Accessory Type: SMP

Finishes & Materials:

Supplied with:

Tube Clamp Plates

Speedway Tube Clamp Plates (TCP) are specifically designed for use with tubing clamp systems which require 7mm wide fixing slots at 20mm or 40mm slot centres.

The tube clamp plates will allow easy and convenient routing of both instrumentation tubing and cables on the same Speedway Cable Ladder run.

Speedway Tube Clamp Plates are also available with fixing slots at 25mm or 50mm slot centres (to order these items replace the '0' in the part number with '5'). The slots in the tube clamp plates are either 20mm x 7mm (TCP01, TCP02, & TCP03) or 35mm x 7mm (TCP04, & TCP05).

Accessory Type: TCP

○ = Select a Finish & Material

Finishes & Materials:

Tube Clamp Plate 01

Supplied with:

**FIXING
SETS x2**

Part Number: SW-TCP01

Tube Clamp Plate 02

Supplied with:

**FIXING
SETS x2**

Part Number: SW-TCP02

Tube Clamp Plate 03

Supplied with:

**FIXING
SETS x2**

The TCP03 is also suitable for the attachment to the Speedway Channel rung and will allow routing of instrumentation tubing within the cable space or along the underside of the Speedway Cable Ladder.

Part Number: SW-TCP03

Tube Clamp Plate 04

Supplied with:

**FIXING
SETS x4**

Part Number: SW-TCP04

Tube Clamp Plate 05

Supplied with:

**FIXING
SETS x4**

Part Number: SW6-TCP05

Speedway Tube Clamp Plate TCP05 is used for direct fixing or for use with Speedway SW6 only.

SPEEDWAY SUPPORTS

A range of supports, including heavy duty cantilevers and trapeze hangers; designed to work in conjunction with Vantrunk's Speedway Cable Ladder System.

Vantrunk's Speedway Supports are also complemented by the comprehensive Intelok channel support system manufactured to BS 6946. Featuring channel cantilever arms, beam clamps and brackets, which offer solutions to suit all particular site requirements. See the Intelok section for further details.

Heavy Duty Cantilever

The Speedway Heavy Duty Cantilever (HDC) provides a specific means of supporting Speedway cable ladder on vertical fixed structures or channel (strut type) uprights. The heavy duty cantilevers are available to suit Speedway SW4, SW5 & SW6 Cable Ladders for all widths up to and including 900mm wide.

Each Heavy Duty Cantilever has fixing slots to accept the Speedway External Flange Clamps (SW-EFC-#), Adaptable Fixing Brackets (SW-AFB-#) and Hold Down Brackets (SW-HDB-#). The slot pattern allows the adaptable fixing bracket to be fitted either internally or externally on the Speedway cable ladder. The heavy duty cantilever arm back plate has a minimum of two 15mm diameter fixing holes (see table below for details) to accept fixings up to and including M14. The loading table below gives the recommended maximum load for each size of heavy duty cantilever arm for supporting uniformly distributed loads (UDL) such as or for supporting Speedway cable ladder (which should be uniformly loaded to apply two equal point loads onto the cantilever arm).

Speedway Heavy Duty Cantilevers - Safe Working Loads

| Part Number | Ladder size | Arm Length mm | Maximum Load kg | |
|--------------|-------------|---------------|-----------------|--------|
| | | | UDL | Ladder |
| SW-HDC-150-O | 150 | 300 | 629 | 315 |
| SW-HDC-300-O | 300 | 450 | 419 | 210 |
| SW-HDC-450-O | 450 | 600 | 496 | 248 |
| SW-HDC-600-O | 600 | 750 | 690 | 345 |
| SW-HDC-750-O | 750 | 900 | 871 | 435 |
| SW-HDC-900-O | 900 | 1050 | 1045 | 522 |

O = Select a Finish & Material

Finishes & Materials:

Heavy Duty Cantilevers with non-standard arm lengths and alternative fixing slot configurations are available – consult our Design Team for further information. Installation dimensions are given in the following table.

Speedway Heavy Duty Cantilevers - Installation Details

| Part Number | Ladder Width mm | Maximum Load kg | | | |
|--------------|-----------------|-----------------|-------------|-----|-----|
| | | L | No of Holes | A | B |
| SW-HDC-150-O | 150 | 300 | 2 | 70 | N/A |
| SW-HDC-300-O | 300 | 450 | 2 | 70 | N/A |
| SW-HDC-450-O | 450 | 600 | 3 | 55 | 40 |
| SW-HDC-600-O | 600 | 750 | 3 | 105 | 40 |
| SW-HDC-750-O | 750 | 900 | 3 | 155 | 40 |
| SW-HDC-900-O | 900 | 1050 | 3 | 205 | 40 |

SUPPORT SYSTEMS

Ladder Trapeze Hanger

The Speedway Ladder Trapeze Hanger (LTH) provides a dedicated and effective means of installing Speedway cable ladder using a trapeze support arrangement.

Each Ladder Trapeze Hanger has fixing slots to accept the Speedway External Flange Clamps (SW-EFC-#), Adaptable Fixing Brackets (SW-AFB-#) and Hold Down Brackets (SW-HDB-#). The slot pattern allows the Adaptable Fixing Bracket to be fitted either internally or externally on the cable ladder.

The Ladder Trapeze Hanger has 25 x 13.5 end slots to suit the use of M10 or M12 threaded rod hangers. M10 threaded rod hangers can also be utilised for securing the Speedway cable ladder using Speedway External Flange Clamps (SW-EFC), Adaptable Fixing Brackets (SW-AFB) and Hold Down Brackets (SW-HDB). The loading table below gives the recommended maximum load for each size of ladder trapeze hanger when used with Speedway cable ladder (which should be uniformly loaded to apply two equal point loads onto the ladder trapeze hanger).

Speedway Ladder Trapeze Hanger - Safe Working Loads

| Part Number | Ladder Width mm | Ladder Load kg |
|---------------|-----------------|----------------|
| SW-LTH-150-O | 150 | 1193 |
| SW-LTH-300-O | 300 | |
| SW-LTH-450-O | 450 | |
| SW-LTH-600-O | 600 | |

COVERS

Speedway Covers provide mechanical and environmental protection for cables on the cable ladder. Speedway Covers can be supplied in either closed or louvered configurations.

Speedway straight ladder covers are supplied in 1.5m lengths for ease of handling during installation and are 'handed' (i.e. the cover has a different slot and fixing arrangement at each end) but can be installed in either direction as the design of cable ladder fittings covers allow for connection to either end of the straight ladder covers.

Speedway straight ladder covers have an integral joint strip at one end to facilitate connection to abutting straight cable ladder or cable ladder fitting covers. Pre-formed M6 threads are provided at the opposite end of the cover to allow for ease of installation using

M6 threaded bolts. The integral joint strip is fully slotted to allow for adjustment during installation.

Speedway Cable Ladder fittings covers are dimensioned to be an exact fit to the Speedway Cable Ladder fitting and are fitted with integral joint strips on all ends of the cover. Covers for risers will be supplied with easi-bend slots to allow the cover to be formed on site for attachment to the riser fitting.

| Finish & Material | | Gauge |
|---|--|-------|
|  | Stainless Steel | 1.0mm |
|  | Hot Dipped Galvanised Mild Steel | 1.2mm |
|  | Deep Galvanised Silicon Rich Steel | 1.5mm |
|  | Hot Dipped Galvanised Structural Steel | 1.5mm |
|  | Deep Galvanised Structural Steel | 1.5mm |

Covers are supplied as standard in the gauges given in the above table. Other gauges up to and including 2mm are available to order.

Closed Covers

Closed covers fit directly onto the side walls of the Speedway Ladder & fittings to provide mechanical protection and shielding for cables and other equipment within the cable space.

Closed covers of widths of 450mm and above are supplied with Bracing Kits (CBK) (see Bracing Kit Section). Closed Covers are punched with centreline slots to provide for water drainage.

Cover Type: CC

Fitting to Fitting Cover

When joining two abutting cable ladder fittings with a Fitting to Fitting Coupler (FFC) a 200mm gap is created in the cover span. To ensure complete mechanical and environmental protection of the cables, a Fitting to Fitting Cover is required. Fitting to Fitting Covers will be fixed directly to the adjoining covers and will ensure complete protection of cables within the span.

Cover Type: CC-FFC or CL-FFC

Louvered Covers

Louvered Covers are similar to closed covers but with the addition of louvers for improved air flow through the cable space. Louvered covers are particularly useful where heavy duty power cables are being used. Most traditional cable management systems offer a raised cover for ventilation.

Conventional raised covers have a number of considerations to be taken into account before installing them. First of which is that the cover will be susceptible to being lifted off in excessive winds, also the extra brackets and fixings will add to the installation time of each cover. Raised covers loading performance is far less than the loading performance of a close fitting louvered cover and due to the cover only being supported locally at the fixing point the raised cover is susceptible to sagging which will allow water and debris to build up. Louvered Covers of widths of 450mm and above are supplied with Bracing Kits (CBK) (see Bracing Kit Section).

Cover Type: CL

Peaked Covers

Peaked Covers are closed covers which are formed into a peak with an overall height of 50mm to shed sand, snow, water etc.

Cover Type: CP

Cover Fixing Kits

Speedway covers are supplied complete with the required number of cover fixing kits (VCF3). The cover fixing kits are common to closed, louvered and peaked covers. The covers are secured to the ladder using pre-punched slots which are incorporated into the flanges of all Speedway ladder and fittings.

| VCF3-G Cover Fixing Kit | | VCF3-S Cover Fixing Kit | |
|--|--------------------------------|--|--------------------------------|
|  | |  | |
| M6x12-BN-GA | M6x12mm Roofing Bolt & Nut | M6X12-PHS-SS-A4 | M6x12mm Pan Head Screw |
| M6-SW-GA | M6 Internal Shake Proof Washer | M6-FW-SS-A4 | M6 Flat Washer |
| | | M6-SW-SS-A4 | M6 Internal Shake Proof Washer |
| | | M6-HN-SS-A4 | M6 Hex Nut |

It is recommended that additional cover kits are ordered to suit contingency requirements during installation (5% is suggested).

The number of fixing kits for securing the cover to the ladder or fitting supplied with each type of cover is given in the following table:

| Straight Ladder & Fitting Type | Quantity of Cover Fixing Kits |
|--------------------------------|----------------------------------|
| Straight Ladder | 8 |
| Flat Elbows | 6 |
| Inside & Outside Risers | 1 per facet* with a minimum of 4 |
| Equal & Unequal Tees | 9 |
| Crosses | 12 |
| Reducers | 4 |

* N° of facets = N° of rungs plus 1. See Risers for details.

Bracing Kits

Bracing kits are provided for additional strengthening of closed and louvered covers for all widths of 450mm and above. Bracing kits are not required for covers of widths less than 300mm.

All closed and louvered covers of widths 450mm and above have pre-formed M6 threaded fixing holes as standard to accept the fixings for the bracing kits.

It is recommended that additional bracing fixing kits are ordered to suit contingency requirements during installation (10% is suggested).

UNIQUELY VANTRUNK

SLOT PATTERN

Vantrunk Cable Tray features a unique versatile slot pattern that provides onsite flexibility

INTEGRAL COUPLING

Vantrunk Cable Tray fittings in the MR & HR range include integrated couplings that provide the following benefits:

- Reduced labour time
- Eliminate the need for separate couplers
- Reduced number of fixings
- Full support through a fish plate design
- Improved Earth Continuity

PROFILE

The Vantrunk Cable Tray features fully returned flanges and is available in a wide range of sidewall heights

HOW TO ORDER

CODE SYSTEM EXPLAINED

The information given on these pages should be used as a guide when ordering cable tray, fittings, covers and accessories. For more detailed information and examples refer to the relevant page within the catalogue.

Straight Cable Tray

| System Type | Tray Length | Width | Finish & Material | Gauge |
|-------------|-------------|-------|-------------------|-------|
|-------------|-------------|-------|-------------------|-------|

eg. HR – SL3 – 050 – GA – 0.9

Cable Tray, Heavy Duty, Straight Length, 3000mm Long, 50mm Wide, Hot Dip Galvanised, 0.9mm.

Cable Tray Fittings

| System Type | Fitting Type | Width(s) | Radius | Finish & Material | Gauge |
|-------------|--------------|----------|--------|-------------------|-------|
|-------------|--------------|----------|--------|-------------------|-------|

eg. WO – FB90 – 200 – 150R – SS – 1.5

Cable Tray, 100mm SideWall, Flat Bend 90°, 200mm Wide, 150mm Rad, Grade 1.4404 (316L) Stainless Steel, 1.5mm.

Cable Tray Accessories

| System Type | Accessory Type | Finish & Material | Gauge |
|-------------|----------------|-------------------|-------|
|-------------|----------------|-------------------|-------|

eg. HR – DF – GA – 0.9

Cable Tray, Heavy Duty, Divider Straight Length, 3000mm Long, Hot Dip Galvanised.

Straight Cable Tray Covers

| System Type | Cover Type | Tray Type | Width | Finish & Material | Gauge |
|-------------|------------|-----------|-------|-------------------|-------|
|-------------|------------|-----------|-------|-------------------|-------|

eg. HR – CC – SL3 – 050 – GA – 0.9

Cable Tray, Heavy Duty, Closed Cover, Straight Length, 3000mm Long, 50mm Wide, Hot Dip Galvanised, 0.9mm.

Cable Tray Fitting Covers (Include the Radius detail if a non-standard radius fitting is required)

| System Type | Cover Type | Cover Length | Width | Radius | Finish & Material | Gauge |
|-------------|------------|--------------|-------|--------|-------------------|-------|
|-------------|------------|--------------|-------|--------|-------------------|-------|

eg. WO – CV – FB90 – 200 – 150R – SS – 1.5

Cable Tray, 100mm SideWall, Raised Cover, Flat Bend 90°, 200mm Wide, 150mm Rad, Grade 1.4404 (316L) Stainless Steel, 1.5mm.

Couplers

| System Type | Coupler Type | Finish & Material | Gauge |

Details on the full range of standard Finishes and Materials are given in the Finish and Materials Section (page 23) and Engineering Data Section (page 210).

STRAIGHT LENGTHS

The Vantrunk Cable Tray System is manufactured in two profiles as standard based around two different side wall heights, each of which gives the cable tray its specific load carrying capabilities.

Medium Duty Return Flange
 Cable tray system has a side wall height of 25mm.

Heavy Duty Return Flange
 Cable tray system has a side wall height of 50mm as standard.

Other Heavy Duty sidewall heights from 30mm to 150mm are available to order – consult our Sales Team for details.

For further details on sidewall heights refer to the Engineering Data Section (Page 226) within this catalogue.

Straight Tray

Vantrunk Cable Tray is available in widths from 50mm to 900mm. The width is measured internally between the side walls.

Vantrunk Straight Cable Tray is available in standard lengths of 3m.

The Vantrunk Cable Tray features a slot pattern which is standard across the range of cable trays. Based on a repeating pattern of 12mm by 8mm width wise slots and 20mm by 8mm length wise, the Vantrunk Cable

Tray slot pattern suits cable ties, banding and cable cleats with M6 fixings. See the Cable Tray Engineering Section for details.

Vantrunk Medium Duty return flange Cable Tray is suitable for applications where medium duty cable loads are to be supported over short to medium spans. Vantrunk Heavy Duty return flange cable tray is suitable for applications where heavy duty cable loads are to be supported over longer spans.

Medium Duty Return Flange Straight Tray

Gauge & weights are given for the hot dip galvanised mild steel cable tray. Refer to the Engineering Data Section (Page 227) for other materials and gauges.

FITTINGS

The Vantrunk Cable Tray system comprises of a full range of perforated cable tray fittings that provide changes in direction, changes in width and can be used to create intersections between straight runs. Vantrunk cable tray fittings feature an integral coupler.

The range of Cable Tray fittings includes Flat Bends, Risers, Equal & Unequal Tees, Four Ways and Reducers.

Vantrunk Cable Tray fittings are available in widths of 50mm to 900mm. The width is measured externally between the side walls to facilitate the use of the integral coupler.

The Medium Duty Return Flange fittings have a nominal sidewall height of 25mm and standard Heavy Duty

Return Flange fittings have a nominal sidewall height of 50mm. Other heavy duty sidewall heights from 30mm to 150mm are available to order.

Vantrunk Cable Tray Risers are supplied with a radius of 300mm as standard whereas all other fittings are supplied with a radius of 75mm for widths up to and including 150mm and a nominal internal radius of 150mm for widths of 200mm and above. Other radii are available to order.

FLAT BENDS

Flat Bends are used to create fixed angular changes in direction in the same plane, between horizontal cable tray runs when the cable tray is installed in the horizontal plane and between vertical cable tray runs when the cable tray is installed in the vertical plane.

Vantrunk Cable Tray Flat Bends are available in fixed angles of 30°, 45°, 60° and 90° as standard.

Vantrunk Cable Tray Flat Bends have a nominal internal radius of 75mm for widths up to and including 150mm and a nominal internal radius of 150mm for widths of 200mm and above. Other radii are available to order.

Information shown is for Heavy Duty Return Flange Flat Bends, data for other sidewall heights available on request.

RISERS

Risers are used to create angular changes in direction between cable tray runs in different planes and can be used in both the horizontal and vertical orientations.

Vantrunk Heavy Duty Return Flange Cable Tray Risers are specially designed to create angular changes in direction to a set angles of 30°, 45°, 60° or 90° at a radius of 300mm, other radii are available to order.

| | VR30 | VR45 | VR60 | VR90 |
|---------|---|---|--|---|
| Inside |  |  |  |  |
| Outside |  |  |  |  |

Vantrunk Medium Duty Return Flange Cable Tray Risers are designed as a full variable riser that can be formed from 0° to over 90° as both an inside (internal) riser or outside (external) riser. When formed to 90°, Medium Duty cable tray risers have a nominal radius of 300mm. Other radii are available to order.

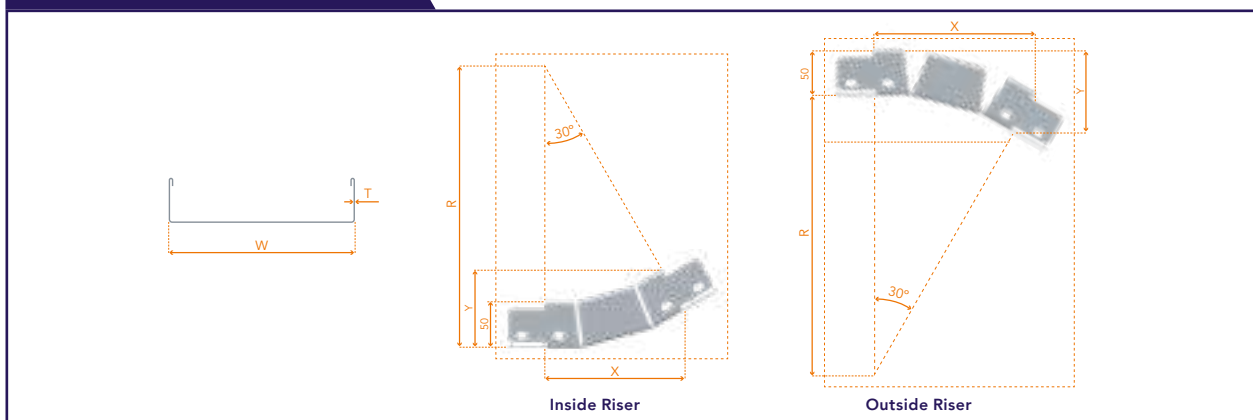

Depending on material and gauge Cable Tray Risers can be supplied flat as variable risers for forming to either an inside (internal) riser or an outside (external) riser or supplied as a pre-formed inside or outside riser to a fixed angle. Consult our Sales Team for further details.

| | | | |
|---|---|--|---|
|  |  |  |  |
| Supplied Flat | Inside Riser | Outside Riser | Offset Riser |

Variable risers can also be used to create offsets to suit particular site installation requirements. Information shown is for Heavy Duty Return Flange Risers, data for other sidewall heights available on request.

CABLE TRAY TEES

Tees are used to create right angle connections in the same plane, between horizontal cable tray runs when the cable tray is installed in the horizontal plane and between vertical cable tray runs when the cable tray is installed in the vertical plane.

Vantrunk Cable Tray Tees are available in combinations of widths of 50mm to 900mm. Tees with the same main & branch width are called Equal Tees (ET). Tees which have a different main width to the branch width are called Unequal Tees (UT).

Unequal/unequal tees, where all three exits are different, are available to order. Consult our Sales Team for further details.

Information shown is for Heavy Duty Return Flange tees, data for other sidewall heights available on request.

Mounting Frame

FOUR WAYS

Four Ways are used to create right angle intersections in the same plane, between horizontal cable tray runs when the cable tray is installed in the horizontal plane and between vertical cable tray runs when the cable tray is installed in the vertical plane.

Vantrunk Cable Tray Four Ways have a nominal internal radius of 75mm for widths up to and including 150mm and a nominal internal radius of 150mm for widths of 200mm and above. Other radii are available to order.

Information shown is for Heavy Duty Return Flange Four Ways, data for other sidewall heights available on request.

Heavy Duty Four Ways

Vantrunk Heavy Duty Return Flange Cable Tray Four Ways have a main width W which is identical on all four cable entry/exit points.

Fitting Type: HR-FW

| Part Number | Width W mm | T mm | R mm | X mm | Y mm | Weight (kg) |

REDUCERS - STRAIGHT, LEFT & RIGHT

Reducers are used to create a reduction in width along the cable tray run.

Straight reducers (SR) are used to create a concentric reduction, having an equal width reduction on both sides. Left hand reducers (LR) and right hand reducers (RR) are used to create offset reductions to suit particular site installation requirements.

Left hand reducers have the width reduction on the left when viewed from the primary width and right hand reducers have the width reduction on the right when viewed from the primary width.

Vantrunk cable tray Straight reducers are available in any combination of widths from 900mm to 75mm and

from 450mm to 50mm as standard. Offset reducers are available in any combination of widths, from 900mm to 50mm.

Vantrunk cable tray reducers have a standard length of 250mm.

Information shown is for Heavy Duty Return Flange Reducers, data for other sidewall heights available on request.

Not Required:

COUPLERS

A full range of couplers are available for the Vantrunk Cable Tray system, providing a secure and versatile means of connecting straight cable tray lengths.

Vantrunk supply two alternative methods of coupling straight lengths of tray together that both ensure a safe straight joint. Unless otherwise stated, the Flat Bar Coupler will be supplied as standard.

Vantrunk also supply a range of additional couplers including horizontal & vertical adjustable couplers which allow offsets to be made in cable tray runs to suit specific site installation requirements.

Information shown is for Heavy Duty Return Flange couplers, data for other sidewall heights is available on request.

Heavy Duty Flat Bar Coupler

The Vantrunk Heavy Duty Return Flange cable tray flat bar coupler is the standard means of connecting straight lengths of cable tray and is available in the full range of sidewall heights to match that of the cable tray range. Unless otherwise specified, the flat bar coupler will be supplied as standard. Flat Bar Couplers are supplied individually and with fixings.

○ = Select a Finish & Material

Finishes & Materials:

Finishes & Materials:

Supplied with:

Not Required:

Heavy Duty Flat Horizontal Adjustable Coupler

The Vantrunk Heavy Duty Return Flange cable tray horizontal adjustable coupler allows horizontal adjustment between adjacent lengths of cable tray and is available in the full range of sidewall heights to match that of the Heavy Duty cable tray. Horizontal Adjustable Couplers are supplied individually and with fixings.

Fitting Type: HR-FHAC

Part Number: HR-FHAC-○

○ = Select a Finish & Material

Finishes & Materials:

Supplied with:

**FIXING
SETS** x4

Not Required:

Heavy Duty Flat Vertical Adjustable Coupler

The Vantrunk Heavy Duty Return Flange cable tray vertical adjustable coupler is the standard means of allowing vertical adjustment between adjacent lengths of cable tray and is available in the full range of sidewall heights to match that of the Heavy Duty cable tray.

The vertical adjustable coupler features easi-bend slots which allow the couplers to be adjusted on site to create combined horizontal & vertical offset connections, tray connections onto the side of a cable tray run to form tee connections, or connections directly to a wall or floor. Vertical Adjustable Couplers are supplied individually and with fixings.

ACCESSORIES

The Vantrunk cable tray system is complemented by a range of accessories designed to aid installation and to add additional functionality & flexibility to the cable tray installation.

Where required the information shown is for Heavy Duty Return Flange accessories, data for other sidewall heights is available on request.

Tray Earth Bonding Strap

The tray earth bonding strap for cable tray (EBS-05) is designed for use in electrical installations where an additional means of earthing or electrical bonding is specified. The earth bonding strap comprises of a 4mm² 100mm long tinned copper braid with M6 tinned copper end connectors. The earth bonding strap is suitable for use with all types of Vantrunk cable tray.

Fitting Type: EBS-05**Part Number: EBS-05**

○ = Select a Finish & Material

Earth bonding straps are not supplied with fixings. Recommended fixings – two M6 x 12 pan head screws and M6 nuts (plus M6 flat washers for stainless steel). Consult our Sales Team for details.

Tray Insulating Assemblies

A comprehensive range of nylon insulating assemblies are available to suit those applications where there is a requirement to prevent bi-metallic corrosion occurring in either the Vantrunk cable tray system or the support structure. A typical example is a stainless steel Vantrunk cable tray system mounted on galvanised or painted steel supports.

The insulating assembly is based on nylon base pads, nylon bushes and nylon washers which when used totally encapsulate the fixings and provide electrical separation between the Vantrunk cable tray system and the supporting structure.

M10 Nylon Bush

Part Number: BUSH-16x##-NY

Nylon Bush Length '##' = Steel Thickness (mm)

The length of the nylon bush is equal to the thickness of the supporting steelwork (##). The M10 nylon bush requires a 17mm diameter hole in the supporting steelwork.

M6 Nylon Bush

Part Number: BUSH-6x##-NY

Nylon Bush Length '##' = Steel Thickness (mm)

The length of the nylon bush is equal to the thickness of the supporting steelwork (##). The M6 nylon bush requires a minimal 9mm diameter hole in the supporting steelwork.

M10 Fixing Bolt

Part Number: M10x□-HS-SS-A4

Minimum Thread Length '□' = 22 + ##

The minimum thread length for the fixing bolt is 22mm plus the thickness of the supporting steelwork. Refer to the table below for details of the fixing bolts.

M6 Fixing Bolt

Part Number: M6x□-PHS-SS-A4

Minimum Thread Length '□' = 22 + ##

The minimum thread length for the fixing bolt is 22mm plus the thickness of the supporting steelwork. Refer to the table below for details of the fixing bolts.

SSM10x□HS Fixing Bolt Details

| Part Number | Thread Length □ | Description |
|-----------------|--------------------|---|
| M10x25-HS-SS-A4 | 25mm | M10 x 25 Hex Head Set Screw Stainless Steel |
| M10x30-HS-SS-A4 | 30mm | M10 x 30 Hex Head Set Screw Stainless Steel |
| M10x35-HS-SS-A4 | 35mm | M10 x 35 Hex Head Set Screw Stainless Steel |
| M10x40-HS-SS-A4 | 40mm | M10 x 40 Hex Head Set Screw Stainless Steel |

M6x□-PHS-SS-A4 Fixing Bolt Details

| Part Number | Thread Length □ | Description |
|-----------------|--------------------|--|
| M6x25-PHS-SS-A4 | 25mm | M6 x 25 Pan Head Screw Stainless Steel |
| M6x30-PHS-SS-A4 | 30mm | M6 x 30 Pan Head Screw Stainless Steel |
| M6x35-PHS-SS-A4 | 35mm | M6 x 35 Pan Head Screw Stainless Steel |
| M6x40-PHS-SS-A4 | 40mm | M6 x 40 Pan Head Screw Stainless Steel |

'□' - Fixing Bolt Thread Length (See table opposite)

'##' - Thickness of supporting steelwork in mm.

For Example:

If the tray is to be mounted to the steelwork without a HDB, order: TR-SS-INS12. If the thickness of the Steelwork = 12mm. The length of the Nylon Bush is also 12mm = BUSH-6x12-NY. This means that the Minimum Thread Length of the Fixing Bolt = 22 + 12 = 34mm. Rounding this figure up to the nearest standard bolt length of 35mm, the supplied bolt = M6x35-PHS-SS-A4

Insulating Assembly Components for Hold Down Bracket

Information shown is for hot dip galvanised carbon steel in the standard gauge; other gauges are available, please consult our Sales Team for details.

Straight tray dividers are not supplied with fixings (3 fixings required per straight divider).

Recommended fixings – M6 x 12 pan head screw and M6 nut (plus M6 flat washer for stainless steel). Consult our Sales Team for details.

Subject to order requirements, straight tray dividers may be supplied in 1.5m lengths to suit delivery & shipping needs.

Tray Fitting Divider

Tray fitting dividers are available for cable segregation and separation purposes on fittings. The tray fitting divider is supplied as a 600mm straight length and is notched to allow for forming around flat bends, tees, crosses & reducers. Tray fitting dividers are available to suit all cable tray sections.

Fitting Type: DF-FL-0.6

| Part Number | Dimensions mm | | | |

COVERS

The Vantrunk Cable Tray System is accompanied by an extensive range of covers that are used in conjunction with cable tray straight lengths and fittings in order to provide mechanical and environmental protection to the cables and other items installed on the cable tray.

Covers are available to suit the Medium Duty Return Flange and Heavy Duty Return Flange Cable Tray Systems and can be installed as either closed (non-ventilated, plain and close-fitting) or ventilated (plain and raised cover) depending on the type of cover fixing kit supplied with each cover. Ventilated covers have a ventilation gap of 19mm.

Covers are available in standard and non-standard gauges to suit particular site installation requirements, consult our Sales Team for further details.

Heavy Duty Cable Tray Covers

Cover Fixing Kits

Vantrunk cable tray covers are supplied complete with all necessary fixing kits. Each fixing kit comprises of a preformed mounting bracket, a corrosion resistant M6 spire nut, two M6 screws and one M6 nut.

The general method of assembly for the Vantrunk cable tray cover is shown in the following image. This method is common to both medium and heavy duty cable trays and to cable tray fittings.

Covers for straight cable tray and cable tray fittings (standard radius) are supplied with the appropriate number of cover fixing kits as follows:

| Tray Type | Width | |
|---------------|---------------|----------------|
| | 50mm to 150mm | 200mm to 300mm |
| Straight Tray | 6 | 6 |

| Fitting Type | Width | | |
|-----------------|--------------|----------------|----------------|
| | 50mm to 75mm | 100mm to 150mm | 200mm to 300mm |
| 30° Flat Elbows | 2 | 3 | 3 |
| 45° Flat Elbows | 2 | 3 | 3 |
| 60° Flat Elbows | 3 | 3 | 4 |
| 90° Flat Elbows | 3 | 3 | 4 |

| Fitting Type | Width | |
|-------------------------|---------------|----------------|
| | 50mm to 150mm | 200mm to 300mm |
| Inside & Outside Risers | 4 | 4 |
| Equal & Unequal tees | 3 | 4 |
| Four Ways | 4 | 4 |
| Reducers | 4 | 4 |

Each cover fixing kit is supplied with the appropriate cover mounting bracket for either a non-ventilated cover or ventilated cover based on the part number ordered. Dimensions for the cover mounting brackets are as follows:

| Cover Type | Bracket Height Hb mm |
|-------------------------------|----------------------|
| Medium duty closed covers | 28 |
| Medium duty ventilated covers | 53 |
| Heavy duty closed covers | 53 |
| Heavy duty ventilated covers | 78 |

Straight Tray Covers

Vantrunk straight tray covers are 3m in length and are available in widths of 50mm to 900mm as standard. Covers are common for both closed and ventilated applications.

Fitting Type: CC-SL3 or CV-SL3

| Tray Width mm | Cover Width Wc mm | Gauge T mm | Weight kg |
|---------------|-------------------|------------|-----------|
| 50 | 59 | 1.2 | 2.51 |
| 75 | 84 | | 3.17 |
| 100 | 109 | | 3.92 |
| 150 | 159 | | 5.43 |
| 200 | 209 | | 6.74 |
| 225 | 234 | | 7.70 |
| 300 | 309 | | 9.96 |

Weights shown are for standard hot dip galvanised finish only, for Stainless Steel & Silicon Rich Steel weight conversion factors please refer to the Cable Tray technical section.

Fitting Covers

Vantrunk cable tray fitting covers are available in widths of 50mm to 900mm as standard. Covers are common for both closed and ventilated applications.

Fitting Type: CC-Fitting Type or CV-Fitting Type

Order details for all fittings except risers are as follows:

Tray Type - Cover Type - Tray Fitting Type - Width - Radius - Finish & Material - Gauge.

Omit the radius detail if the standard radius fitting is required.

Order example:

HR-CV-FE30-300-150R-GA-1.2 Vantrunk Heavy Duty Return Flange Cable Tray Ventilated Cover, 30° Flat Elbow, 300mm Wide, 150mm Radius, c/w Cover Fixing Kits, Hot Dip Galvanised Mild Steel, 1.2mm material thickness.

Order example:

HR-CC-FE90-750-300R-SS-1.0 Vantrunk Heavy Duty Return Flange Cable Tray Closed Cover, 90° Flat Elbow, 750mm Wide, 300mm Radius, c/w Cover Fixing Kits, Stainless Steel (316 Grade), 1.0mm material thickness.

Covers for inside and outside riser fittings are supplied pre-formed to angles of 30°, 45°, 60° or 90° to match the angle of the riser.

CABLE TRAY SUPPORTS

A range of supports, including overhead brackets, cantilevers and trapeze hangers; designed to work in conjunction with Vantrunk's Cable Tray System.

Vantrunk's Cable Tray Supports are also complemented by the comprehensive Intelok channel support system manufactured to BS 6946. Featuring channel cantilever arms, beam clamps and brackets, which offer solutions to suit all particular site requirements. See the Intelok section for further details.

Stand-off Bracket

The Vantrunk cable tray stand-off bracket (SOB) is used to raise the cable tray clear of the floor or wall, providing access to the underside of the cable tray for fitting of cable ties and the securing of nuts. Fully slotted to provide on-site adjustment, the stand-off bracket is common to the full range of Vantrunk cable tray systems.

The recommended maximum load given in the loading table below for each size of tray stand-off bracket is based on use with Vantrunk cable tray and with a uniformly distributed load (UDL) onto the tray stand-off bracket.

Stand-off Bracket

| Part Number | Tray Width mm | Dimensions mm | | | | | | Maximum UDL Kg |

O = Select a Finish & Material

Finishes & Materials:

Overhead Hanger Brackets

Overhead Hanger Brackets (OHB) are suitable for supporting narrower widths of cable tray using threaded rod. Available in widths from 75mm to 300mm, the tray overhead hangers are suitable for use with all types of Vantrunk cable tray.

The loading table below gives the recommended maximum load for each size of tray overhead hanger when used with Vantrunk cable tray and with a uniformly distributed load (UDL) onto the tray overhead bracket.

Overhead Hanger Brackets

| Part Number | Tray Width mm | Dimensions mm | | | | Maximum UDL Kg |
|--------------|---------------|---------------|-----|----|-----|----------------|
| | | Wa | H | D | T | |
| AC-OHB-50-O | 50 | 52 | 187 | 11 | 1.5 | 40 |
| AC-OHB-75-O | 75 | 77 | | | | 78 |
| AC-OHB-100-O | 100 | 102 | | | | 91 |
| AC-OHB-150-O | 150 | 152 | | | 1.8 | 76 |
| AC-OHB-225-O | 225 | 227 | | | | 150 |
| AC-OHB-300-O | 300 | 302 | | | | 150 |

O = Select a Finish & Material

Finishes & Materials:

Flat Bar Hanger

The Flat Bar Hanger (FBH) is an effective means of installing smaller widths of Vantrunk cable tray using a central threaded rod hanger.

The flat bar hanger has a central hole to suit the use of M10 or M12 threaded rod hangers. Each flat bar hanger has fixing slots for direct fixing through the bed of the cable tray.

The loading table below gives the recommended maximum load for each size of flat bar hanger when used with Vantrunk cable tray and with a uniformly distributed load (UDL) onto the flat bar hanger.

Flat Bar Hanger

| Part Number | Tray Width mm | Dimensions mm | | | Maximum UDL Kg |
|--------------|---------------|---------------|----|-----|----------------|
| | | Wa | Wb | H | |
| AC-FBH-50-○ | 50 | 66 | 40 | 150 | 125 |

| AC-FBH-100-○ | 100 | 116 | 40 | 150 | 86 |
| AC-FBH-150-○ | 150 | 172 | 40 | 150 | 47 |
| AC-FBH-225-○ | 225 | 247 | 40 | 150 | 32 |
| AC-FBH-300-○ | 300 | 322 | 40 | 150 | 24 |

○ = Select a Finish & Material

Finishes & Materials:

Trapeze Hanger Bracket

The Trapeze Hanger Bracket (THB) provides a dedicated and effective means of installing Vantrunk cable tray using a trapeze support arrangement with two threaded rod hangers.

The trapeze hanger bracket has 11mm holes to suit the use of M10 threaded rod hangers. Each trapeze hanger bracket has fixing holes for use with the tray hold down bracket (HDB) and elongated holes for direct fixing through the bed of the cable tray.

The loading table below gives the recommended maximum load for each size of trapeze hanger bracket when used with Vantrunk cable tray and with a uniformly distributed load (UDL) onto the trapeze hanger bracket.

Tray Overhead Hanger

| Part Number | Tray Width (mm) | Dimensions mm | | | | Total Tray Load (kg) |

| AC-THB-300-○ | 300 | 464 | | 424 | | 1615 |

○ = Select a Finish & Material

Finishes & Materials:

Tray Cantilever Arm

Vantrunk Tray Cantilever Arms (TCA) are suitable for supporting cable tray from channel or flat surfaces. Available for cable tray of widths from 50mm to 900mm, the Vantrunk tray arms have M10 clearance holes for fixing to the supports and M6 clearance holes to allow for fixing through the bed of the cable tray.

Vantrunk tray cantilever arms have one fixing hole for arm lengths up to & including 100mm, and two fixing holes for arm lengths of 150mm and above. The Vantrunk tray cantilever arms are suitable for use with the full range of Vantrunk cable trays.

The loading table below gives the recommended maximum load for each size of trapeze hanger bracket when used with Vantrunk cable tray and with a uniformly distributed load (UDL) onto the tray cantilever arm.

Vantrunk Tray Arm

| Part Number | Dimensions mm | | | | Maximum UDL Kg |

UNIQUELY VANTRUNK

Vantrunk's innovation department has further strengthened the Intelok Steel Framing System with the introduction of the Triple Slotted Channel and Welded Starter Brackets.

These products are designed in order to increase flexibility during installation and to remove the

need for on-site drilling when mounting to the existing structure.

When used in conjunction with the Intelok Quickfit bracket range the system can provide substantial cost savings through a reduction in labour, parts and overall topside weight.

Deep Triple Slotted

Back to Back Channel

Welded Starter Brackets

QUICKFIT BRACKETS

Vantrunk's unique Intelok Quickfit system of brackets and cantilevers is a factory assembled, time saving, easy to fit alternative to separate nuts, bolts and washers

WHY QUICKFIT YOUR BRACKETS?

- Quick and simple to assemble, approximate 67% savings on installation time
- Fewer components to order
- Simplified stock control
- Easier estimating

VANTRUNK
INTELOK QF[®]
CHANNEL BRACKETRY

SLIP RESISTANT SERRATED CHANNEL

As standard Vantrunk Steel Framing Intelok Channel comes equipped with serrations on the return flange which significantly increases the resistance to slip. The Steel Framing Intelok Channel is tailor made for applications in areas of considerable vibrations such as offshore platforms and power plants.

Deep Channel Plain

- Steel with a Minimum yield strength 280 N/mm².
- Beams are assumed to be simply supported.
- Load and deflection are calculated using a safety factor of 1.6 and an allowable stress of 175 N/mm².
- Results given are for Pre-galvanised steel.
- Beam loads are calculated from the column face and effective length in BS5950.
- The tables show:
 - The max safe working load,
 - the load to give 1-200 deflection,
 - load to give 1-360 deflection - the deflection used will depend on the installation designer.
- This also applies to Point and UDL loads.

Shallow Channel Plain

- Steel with a Minimum yield strength 280 N/mm².
- Beams are assumed to be simply supported.
- Load and deflection are calculated using a safety factor of 1.6 and an allowable stress of 175 N/mm².
- Results given are for Pre-galvanised steel.
- Beam loads are calculated from the column face and effective length in BS5950.
- The tables show:
 1. The max safe working load,
 2. the load to give 1-200 deflection,
 3. load to give 1-360 deflection - the deflection used will depend on the installation designer.
- This also applies to Point and UDL loads.

Fitting Type: IC-CNL-S-P

Part Number: IC-CNL-S-P-SL□-○

Deep Channel Triple Slotted

- Steel with a Minimum yield strength 280 N/mm².
- Beams are assumed to be simply supported.
- Load and deflection are calculated using a safety factor of 1.6 and an allowable stress of 175 N/mm².
- Results given are for Pre-galvanised steel.
- Beam loads are calculated from the column face and effective length in BS5950.
- The tables show:
 - The max safe working load,
 - the load to give 1-200 deflection,
 - load to give 1-360 deflection - the deflection used will depend on the installation designer.
- This also applies to Point and UDL loads.

Vantrunk Channel Nut

The Intelok Channel has serrated return flanges which provide greatly enhanced slip resistance, essential in areas of vibration and where close inspection of completed installations is not possible.

| | | |
|--|---|--|
|  <p>The Vantrunk Intelok Channel Nut can be supplied in plain, short and long spring configurations to suit the client's application.</p> |  <p>The Vantrunk Intelok Nut is stocked in a number of thread sizes including M6, M8, M10 and M12.</p> |  <p>The Vantrunk Intelok Channel Nut can be supplied in three main material & finishes which are Zinc Plated, Galvanised and Stainless Steel.</p> |

INTELOK BRACKETRY & BEAM CLAMPS

Brackets are primarily designed to be used to provide mechanical strength and reinforcement to a joint when used to connect channel together. The Vantrunk Steel Framing System comes equipped with one of the industry's most comprehensive and versatile range of brackets. The Steel Framing Brackets allow for infinite varieties of permanent and temporary support structures.

Every Bracket in the Vantrunk Steel Framing Range comes complete with a 15.2mm fixing hole to accommodate fixings up to and including M12.

The Steel Framing Range of Brackets are manufactured in either Hot Dip Galvanised Mild Steel or Stainless Steel 316 Marine Grade. Vantrunk Steel Framing Brackets manufactured in Carbon Steel have a material gauge of 6mm and brackets manufactured in Stainless Steel have a material gauge of 5mm.

All Steel Framing Brackets are manufactured out of steel with minimum yield strength of 170N/mm² in accordance with BS 6946.

The seven groups of brackets (see page 160) are all provided within the Steel Framing Brackets Range, which will accommodate all of our user's installation requirements. For more information on the Vantrunk Bracket Range please contact the Vantrunk Technical Team.

Enhanced Option

Vantrunk's unique Intelok Quickfit System of brackets and cantilevers are factory assembled with channel nuts, setscrews, washers & special plastic sleeves. The sleeves ensure that the correct spacing is maintained between the bracket and the channel nut enabling it to be easily located and quickly assembled and also ensures that the channel nut is held captive in transit whilst allowing rotation of the fixing assembly during installation.

To install the Intelok Quickfit system of brackets & cantilevers the nuts are aligned with the open slot of the channel. The assembly is placed in position, the setscrew turned by hand through 90° to locate the channel nut under the return flange of the channel and the setscrew tightened. The channel nuts ensure positive location within the channel. The entire assembly operation takes approximately one third of the time required to fix similar brackets and cantilevers by the conventional spring nut method.

Why Quickfit your Brackets?

- Easier and quicker to assemble.
- Less components to order.
- Approximate 65% savings on installation time.
- Simplified stock control.
- Easier estimating.

Conventional Bracket

- Number of individual components = 10
- Number of order items = 4
- Assembly time = 135 secs

Quickfit Bracket

- Number of individual components = 1
- Number of order items = 1
- Assembly time = 45 secs (**66.6% saving**)

It couldn't be easier to order a Quickfit Bracket with our **NEW** Simplified Ordering System

1. All brackets with the **QF** symbol can be supplied as Quickfit.
2. Select the bracket part number required.
3. Add the suffix (QF10) for standard M10 Quickfit Brackets.

Quick Guide

Starter Brackets

Starter brackets are designed to be welded to the existing steel structure in order to avoid cold working.

Flat Plate Brackets

Flat Plate Brackets provide joint reinforcement between Steel Framing Channel on the same or on different planes.

90° Angle Brackets

90° Angled brackets allow for right angle joints within a channel framework.

Angle Brackets

Angled brackets come in a range of angles to provide reinforcement to angular channel joints in a framework.

Support Brackets

Designed to offer support and mechanical strength to channels on many different planes.

Shaped & Top Hat Brackets

A captive fixing bracket used to secure channel side by side on the same plane or channel on a horizontal plane to channel on a vertical plane.

Base Brackets

Base Plates are to be used for securing channel to the floor or wall and will help to distribute the concentrated load over a larger area.

Beam Clamps

Beam Clamps are designed to secure Steel Framing Intelok Channel to secondary steelwork or building structures.

VANTRUNK

ENGINEERED FOR EXTREME ENVIRONMENTS

GOLDEN EAGLE PROJECT

The Nexen-operated Golden Eagle project produced first oil on October 30, 2014. Upon completion, the project had expended 179 million hours worked. Located 70 km northeast of Aberdeen, Golden Eagle is the second largest oil discovery in the UK North Sea since Buzzard was discovered in 2001.

HEAVY DUTY CABLE TRAY

VANTRUNK
SPEEDWAY®
EXTREME CABLE LADDER

Vantrunk's Speedway Cable Ladder provides a strong, reliable, easy to install solution providing overall cost savings throughout the project lifespan.

INTELOK SUPPORTS

A range of supports and accessories complement Vantrunk's Cable Management Systems. General purpose single and double channel cantilevers, heavy duty cantilevers, overhead hangers and a comprehensive channel support system manufactured to BS 6946 in conjunction with Intelok Beam Clamps and Brackets offer solutions to suit all particular site requirements.

Single Channel Cantilever Arm (150mm - 900mm)

The Single Channel Cantilever Arm Bracket (IC-CARM-SC) is suitable for supporting light to medium loads. The single channel cantilever arm bracket is available in lengths from 150mm to 900mm for supporting Speedway cable ladder and cable tray. Where heavier load carrying performance is required, the single channel cantilever arm bracket can be reinforced using a cantilever arm prop (IC-PROP-length-#) see page 177. The single channel cantilever arm bracket, based on a conventional strut profile, is suitable for use with both external flange clamps (SW-EFC-#), adaptable fixing brackets (SW-AFB-#) and hold down brackets (SW-HDB-#) for Speedway Cable Ladder and for Cable Tray is suitable for use with the tray hold down bracket (HDB) or for direct fixing through the bed of the cable tray using conventional M6 channel nuts.

Safety Factor of 3.

~ Not recommended without the use of additional support

The loading table below gives the recommended maximum load for each size of single channel cantilever arm bracket for supporting uniformly distributed loads (UDL) such as cable tray or for supporting Speedway cable ladder (which should be uniformly loaded to apply two equal point loads onto the cantilever arm).

| Part Number | L (mm) | Max. UDL (kg) |
|--------------------|--------|---------------|
| IC-CARM-SC-P-150-O | 150 | 363 |
| IC-CARM-SC-P-300-O | 300 | 182 |
| IC-CARM-SC-P-450-O | 450 | 121 |
| IC-CARM-SC-P-600-O | 600 | 91 |
| IC-CARM-SC-P-750-O | 750 | 59 |
| IC-CARM-SC-P-900-O | 900 | 41 |

O = Select a Finish & Material

Finishes & Materials:

Single Channel Cantilever Arm (Continued)

Longer cantilever arm lengths are available for use as part of a pendant assembly where the single channel cantilever arm is suspended vertically to create a support system in conjunction with cantilever arm brackets as shown. Consult our Design Team for loading information.

| Ladder Type | SW4 | SW5 | SW6 |
|-------------|-----------|-----------|-----|
| A | W + 102mm | W + 107mm | |
| B | W + 83mm | W - 79mm | |
| C | W + 79mm | W + 89mm | |
| D | W + 123mm | W + 134mm | |
| L | | W + 150mm | |

Back to Back Channel Cantilever Arm

The Double Channel Cantilever Arm Bracket (IC-CARM-BB) is suitable for supporting medium to heavy loads. The double channel cantilever arm bracket is available in lengths from 150mm to 1200mm for supporting Speedway cable ladder and cable tray. Where heavier load carrying performance is required, the double channel cantilever bracket can be reinforced using a cantilever arm prop (IC-CARM-BB). The double channel cantilever arm bracket, based on conventional back to back strut profiles, is suitable for use with Speedway External Flange Clamps (SW-EFC-#), Adaptable Fixing Brackets (SW-AFB-#) and Hold Down Brackets (SW-HDB-#) for Speedway Cable Ladder and for Cable Tray is suitable for use with the tray hold down bracket (HDB) or for direct fixing through the bed of the cable tray using conventional M6 channel nuts.

Safety Factor of 3.

The loading table below gives the recommended maximum load for each size of double channel cantilever arm bracket for supporting uniformly distributed loads (UDL) such as cable tray or for supporting Speedway Cable Ladder (which should be uniformly loaded to apply two equal point loads onto the cantilever arm).

| Part Number | L (mm) | Max. UDL (kg) |
|---------------------|--------|---------------|
| IC-CARM-BB-P-150-○ | 150 | 398 |

| D | W + 123mm | W + 134mm | |
| L | W + 150mm | | |

Cantilever Arm Prop

A Cantilever Arm Prop (IC-PROP) is used where there is a requirement to increase the effective safe working loads of Single Channel Cantilever Arm Brackets (IC-CARM-SC) and Double Channel Cantilever Arm Brackets (IC-CARM-BB). The Cantilever Arm Prop is particularly effective when used to reinforce cantilever arm brackets carrying heavier duty Speedway Cable Ladders with their correspondingly higher load bearing capabilities.

The Cantilever Arm Prop is available in three sizes:

Cantilever Arm Props

| Part Number | Dimensions (mm) | | |
|--------------------|-----------------|-----|-------|
| | L | X | Y |
| IC-PROP-300-450-O | 300 | 125 | 216.5 |
| | 450 | 425 | 736 |
| IC-PROP-600-750-O | 600 | 425 | 736 |
| | 750 | 725 | 1259 |
| IC-PROP-900-1200-O | 900 | 725 | 1259 |
| | 1050 | 725 | 1259 |

O = Select a Finish & Material

Finishes & Materials:

The Table below gives the recommended maximum safe working load for each size of cantilever arm prop when supporting Speedway Cable Ladder.

Safe Working Loads with Single Channel Cantilevers

| Part Number | Cantilever Type | L (mm) | Max UDL kg |
|--------------------|-------------------|--------|------------|
| IC-PROP-300-450-O | IC-CARM-SC-P-300 | 300 | 748 |
| IC-PROP-300-450-O | IC-CARM-SC-P-450 | 450 | 238 |
| IC-PROP-600-750-O | IC-CARM-SC-P-600 | 600 | 1587 |
| IC-PROP-600-750-O | IC-CARM-SC-P-750 | 750 | 286 |
| IC-PROP-900-1200-O | IC-CARM-SC-P-900 | 900 | 369 |
| IC-PROP-900-1200-O | IC-CARM-SC-P-1050 | 1050 | 179 |

O = Select a Finish & Material

Finishes & Materials:

Safe Working Loads with Double Channel Cantilevers

| Part Number | Cantilever Type | L (mm) | Max UDL kg |
|--------------------|-------------------|--------|------------|
| IC-PROP-300-450-O | IC-CARM-BB-P-300 | 300 | 2136 |
| IC-PROP-300-450-O | IC-CARM-BB-P-450 | 450 | 680 |
| IC-PROP-600-750-O | IC-CARM-BB-P-600 | 600 | 4531 |
| IC-PROP-600-750-O | IC-CARM-BB-P-750 | 750 | 817 |
| IC-PROP-900-1200-O | IC-CARM-BB-P-900 | 900 | 1053 |
| IC-PROP-900-1200-O | IC-CARM-BB-P-1050 | 1050 | 512 |

O = Select a Finish & Material

Finishes & Materials:

Where used with the IC-CARM-SC-P range of single channel cantilever arm brackets, it may be necessary to drill the single channel to accept a fixing for the cantilever arm prop.

Trapeze Support Channel

The Trapeze Support Channel (IC-CNL-D) provides a versatile means of installing Speedway Cable Ladder and Cable Tray using a trapeze support arrangement.

Based on slotted deep channel (strut type) to BS6946, the Trapeze Support Channel has 26 x 13 slots at 50mm pitch and is suited to either M10 or M12 threaded rod hangers. The slotted deep channel is supplied to an exact size to suit each width of Speedway Cable Ladder or Cable Tray and has the slots arranged uniformly along the length of the channel to simplify installation.

The continuous open slot on the trapeze support channel facilitates the use of Speedway External Flange Clamps (SW-EFC), Adaptable Fixing Brackets (SW-AFB) or Hold Down Brackets (SW△-HDB) for securing the Speedway Cable Ladder or for Cable Tray is suitable for use with the tray hold down bracket (HDB) or for direct fixing through the bed of the cable tray using conventional M6 channel nuts.

The tables below give installation details as well as the recommended maximum load for each size of trapeze support channel when used with Speedway Cable Ladder (which should be uniformly loaded to apply two equal point loads onto the ladder trapeze hanger) and Cable Tray (which should also be uniformly loaded).

Consult our Design Team for loading information on non-standard trapeze support channels and non-uniform loading configurations.

For Speedway Cable Ladder

| Part Number | Ladder Width (mm) | L | Ladder Load (kg) |
|---------------------|-------------------|------|------------------|
| IC-CNL-D-S-SL350-O | 150 | 350 | 658 |

Finishes & Materials:

INTELOK CONCRETE INSERTS

Steel Framing Concrete Inserts are manufactured from Steel Framing Intelok Channel profiles. The back of each channel is pressed out to form specially designed strong anchor lugs.

The channel is then filled with a unique profile manufactured from expanded polystyrene foam which prevents the ingress of concrete during the pouring stage of construction. The infill is simply removed by inserting a knife blade down the two continuous slots formed in the profile enabling rapid removal of the infill.

ACCREDITED TO
THE FOLLOWING
STANDARDS

Deep Intelok Concrete Insert

Steel Framing Deep Concrete Inserts are manufactured from 2.5mm, 41 x 41 deep channel with securing lugs at 200mm centres.

Ref. IC-CON-D

Loading Data - Concrete Inserts

| Loading Condition | Deep Channel |
|------------------------------------|--------------|
| Safe Working Load per 200mm module | 670kg |
| Safe Working Load per metre length | 3350kg |
| Safe pull-out load on channel lips | 1000kg |
| Safe shear load - M10 fixings | 1392kg |
| Safe shear load - M12 fixings | 2023kg |

| Part Number |
|--------------|
| IC-CON-D-□-○ |

Finishes & Materials:

□ = Select a Channel Length* ○ = Select a Finish

Loading data is based on concrete with a crushing strength of 33N/mm² and a factor safety of 2.

Steel Framing Deep Concrete Inserts are available in standard lengths of 3m. For lengths other than the standard 3 metres, quote the required length in mm up to 3m (must be divisible by 200).

Intelok Shallow Concrete Insert

Steel Framing Shallow Concrete Inserts are manufactured from 2.5mm, 41 x 21 shallow channel with securing lugs at 200mm centres.

Ref. IC-CON-S

Loading Data - Concrete Inserts

| Loading Condition | Deep Channel |
|------------------------------------|--------------|
| Safe Working Load per 200mm module | 400kg |
| Safe Working Load per metre length | 2000kg |
| Safe pull-out load on channel lips | 1000kg |
| Safe shear load - M10 fixings | 1392kg |
| Safe shear load - M12 fixings | 2023kg |

| Part Number |
|--------------|
| IC-CON-S-□-○ |

Finishes & Materials:

□ = Select a Channel Length* ○ = Select a Finish

Loading data is based on concrete with a crushing strength of 33N/mm² and a factor safety of 2.

Steel Framing Shallow Concrete Inserts are available in standard lengths of 3m. For lengths other than the standard 3 metres, quote the required length in mm up to 3m (must be divisible by 200).

The Concrete Insert above is shown with Protective End Caps. Vantrunk highly recommends the use of Protective End Caps as the cap prevents the ingress of concrete slurry into the insert during installation. (Order Separately for End Caps Page 188).

Intelok Steel Framing Concrete Insert Installation Instructions:

STEP 1: FIXING TO SHUTTERING

Fix the Concrete Insert to the shuttering by nailing through the slots created by the anchor lugs. Fit end caps as necessary to the open ends of the concrete insert. The anchor lugs can be wired onto reinforcement mesh as required to increase the strength of the finished assembly.

STEP 2: REMOVING THE INFILL

After pouring of concrete & removal of the shuttering, remove the polystyrene infill using a knife to cut through the two continuous grooves in the infill. Remove the nails.

STEP 3: INSERTING THE QUICKFIT ASSEMBLY

Vantrunk Quickfit Brackets-Cantilevers are simply inserted into the channel. When the hexagon set screw is rotated through 90° degrees the channel nuts turn into the correct position, it is then easily tightened by a spanner. This saves approximately two thirds of the time taken when using the conventional method of spring channel nuts etc.

The Quickfit assembly can be adjusted along the channel to the desired position before tightening the fixing bolt.

The Vantrunk Intelok Concrete Inserts are also compatible with the conventional style of spring channel nuts.

STEP 4: FINISHED INSTALLATION

INTELOK ACCESSORIES

The Vantrunk Steel Framing System is complemented by a range of accessories.

From a selection of pipe clamps and connectors to end caps and cover strips, the following ancillary items represent cost-effective and practical solutions to most requirements.

Shallow External Connector

Part No. 325AK11-GA

Part No. 325AK11-SS

Shallow Internal Connector

Part No. 325AK13-GA

Part No. 325AK13-SS

Comes complete with necessary fixings. Not structural.

Light Duty Internal Connector

Part No. 336AB08-QQ

Part No. 336AB08-SS

Comes complete with necessary fixings. Not structural. Not suitable for slotted channel.

Light Duty Internal Connector (for Slotted Channel)

Part No. 336AB12-QQ

Part No. 336AB12-SS

Comes complete with necessary fixings. Not structural. Suitable for slotted channel.

Pipe Clamps

A Range of Pipe Clamps are available in a zinc plated finish, please contact the Vantrunk Sales Team for more information. Please note that a minimum order quantity applies for this range of products.

Deep External Connector

Part No. 325AK10-GA

Part No. 325AK10-SS

Protective End Cap

Protective End Caps are designed to close off the open ends of Intelok Deep and Shallow Channel Profiles. End caps are also used with Intelok Concrete Inserts to prevent the ingress of concrete slurry during the pouring process. Manufactured from injection moulded PVC, end caps are available in black or white colours.

| Part Number | Channel Type |
|-------------|-------------------------|
| 325AA10-NY | Deep Channel (Black) |
| 325AA11-NY | Shallow Channel (Black) |
| 325AA12-NY | Deep Channel (White) |
| 325AA13-NY | Shallow Channel (White) |

Cover Strip

Cover Strips are designed to close off the continuous open slots of Intelok Channel Profiles, particularly for decorative purposes or where the channel is used as trunking for the routing of secondary cables. Cover strips are supplied in 3m lengths and are available in extruded white PVC and roll-formed pre-galvanised mild steel or stainless steel material.

| Part Number | Cover Strip Type |
|-------------|-----------------------|
| 339AA10-NY | 3 Mtr Long (PVC) |
| 339AB10-QQ | 3 Mtr Long (Pre-Galv) |
| 339AA10-SS | 3 Mtr Long (SS) |

SPEEDWAY

HEAVY DUTY CABLE TRAY

VANTRUNK
SPEEDWAY®
EXTREME CABLE LADDER

Vantrunk stainless Speedway cable ladder systems, cable tray systems and Intelok secondary support system. Vantrunk have supplied all five phases of the BP Azeri developments from 2002 to 2017.

SECTION 04: UNIVERSAL MOUNTING FRAME SYSTEM FOR ELECTRICAL EQUIPMENT

Vantrunk's Uniframe mounting frames are available in standard widths of 1m and 1.5m, other widths are available on request.

The Uniframe system is highly customisable to accommodate specific project requirements, such as slotted side panels to suit the mounting of electrical equipment - consult our Sales Team for further details.

Uniframe mounting frames are available as a flat pack kit as standard or if required as a pivotable flat pack for rapid onsite assembly.

Available in two configurations, single and double sided with feet for either bolting or welding.

The Uniframe system also includes a variety of accessories which are detailed on the following pages.

Single Sided Configuration

Package includes:

- 2 x Side Panels
- 6 x Mounting Panels
- 3 x Channel Sections
- 1 x Roof Unit

System Type: UF

UF-SM-1000-○-2.0

| Part Number | Width |
|------------------|-------|
| UF-SM-1000-○-2.0 | 1000 |
| UF-SM-1500-○-2.0 | 1500 |

○ = Select a Finish & Material

Finishes & Materials:

Single Sided Configurations are available with feet for welding directly to steelwork. To order add the suffix '-W' to the part code

Double Sided Configuration

- Package includes:
- 2 x Side Panels
 - 8 x Mounting Panels
 - 4 x Channel Rail
 - 2 x Roof Unit
 - 4 x Feet (Bolted or Welded)

System Type: UF

UF-DM-1000-○-2.0

| Part Number | Width |
|------------------|-------|
| UF-DM-1000-○-2.0 | 1000 |
| UF-DM-1500-○-2.0 | 1500 |

○ = Select a Finish & Material

Finishes & Materials:

Double Sided Configurations are available with feet for welding directly to steelwork. To order add the suffix '-W' to the part code

Extra Mounting Panels

| Part Number | Width |
|------------------|-------|
| UF-MP-1000-O-2.0 | 1000 |
| UF-MP-1500-O-2.0 | 1500 |

○ = Select a Finish & Material

Finishes & Materials:

Part Number: UF-MP-1000-○-2.0

Extra Channel Rails

| Part Number | Width |
|------------------|-------|
| UF-CR-1000-O-2.0 | 1000 |
| UF-CR-1500-O-2.0 | 1500 |

○ = Select a Finish & Material

Speedway Mounting Plate

The Speedway Mounting Plate (SMP) provides a means of attaching junction boxes and other items to the speedway Cable Ladder System. Mounting plates are available to suit all Speedway Cable Ladder widths up to & including 900mm for attachment across the face of the cable ladder. The 300mm Speedway Mounting Plate (SW-SMP-300-○) can also be attached between rungs on all widths of Speedway Cable Ladder and can be mounted either within the cable space or below the cable ladder.

Alternative mounting plate designs can be made to order. Contact our Sales Team for more details.

Frame Type: SMP

SW-SMP-150-○

SW-SMP-150
150mm Speedway Mounting Plate

SW-SMP-300
300mm Speedway Mounting Plate

| Part Number | Dimensions (mm) | | | | | |
|--------------|-----------------|-----|-----|-----|----|---|
| | Ladder Width | X | Y | A | B | T |
| SW-SMP-150-○ | 150 | 200 | 100 | 175 | 60 | 2 |
| SW-SMP-300-○ | 300 | 350 | | 325 | | |
| SW-SMP-450-○ | 450 | 500 | | 475 | | |
| SW-SMP-600-○ | 600 | 600 | | 625 | | |
| SW-SMP-750-○ | 750 | 800 | | 775 | | |
| SW-SMP-900-○ | 900 | 950 | | 925 | | |

Recommend Fixings:
Speedway Rungs: M6 Channel Nut and M6 x 12 Pan Head Screw (& M6 Flat Washer for Stainless Steel)

Across Cable Ladder: M6 x 12 Pan Head Screw and M6 Hex Nut (& M6 Flat Washer for Stainless Steel)

Alternative mounting plate designs can be manufactured to special order - Consult our Design Team for further details.

○ = Select a Finish & Material

Finishes & Materials:

Supplied with:

Junction Box Plates

Speedway Junction Box Plates (JBP) provide a versatile means of attaching junction boxes, switches and other equipment directly onto Speedway Cable Ladder and Fittings.

Junction Box Plates are available in five standard sizes to suit all secondary equipment mounting requirements. Junction Box Plates are not supplied with ladder fixings.

Accessory Type: JBP

SW-JBP01-○

| Part Number | Dimensions (mm) | | | | No. of Fixings |
|-------------|-----------------|-----|-----|---|----------------|
| | X | Y | A | T | |
| SW-JBP01-○ | 160 | 165 | 120 | 2 | 2 |

HEAVY DUTY CABLE TRAY

VANTRUNK
SPEEDWAY®
EXTREME CABLE LADDER

Vantrunk stainless Speedway cable ladder systems, cable tray systems and Intelok secondary support system. Vantrunk have supplied all five phases of the BP Azeri developments from 2002 to 2017.

VANTRUNK

SECTION 06: INNOVATIVE DESIGN SOLUTIONS

Combining our extensive industry experience and our continual investment in research and development; Vantrunk have secured our position as the leader in bespoke made to order solutions within the cable management sector.

LIGHTING BRACKETS

Speedway Lighting Brackets

Speedway Accessory Mounting Rungs

Cable Tray Lighting Brackets

ASSEMBLIES FOR SEISMIC ACTIVE AREAS

As Extreme Environment Experts Vantrunk can work closely with customers to overcome obstacles when working in harsh environments around the world such as those presented by seismically active areas.

FLEXIBLE ASSEMBLY

VANTRUNK CABLE TRAY VERTICAL TEES

Manufactured to complement the range of standard Cable Tray fittings, the Vertical Tee provides added flexibility to your installation. Available in Ascent, Descent and Lateral Descent variations.

BRIDGE CABLE SUPPORT

TRANSITION COUPLERS

Bespoke designs that allow connection of Vantrunk Speedway Cable Ladder and Tray products to other Cable Management manufacturer's products. This is an ideal product when looking to install Vantrunk product on a site with existing cable management products.

Speedway Transition Coupler

Cable Tray Transition Coupler

SPEEDWAY Y-FITTINGS

Manufactured to complement the range of standard Speedway fittings, the Speedway Y-Fitting provides added flexibility to your installation. Available in right hand and left hand options.

SPEEDWAY VERTICAL TEES

Manufactured to complement the range of standard Speedway fittings, the Vertical Tee provides added flexibility to your installation. Available in Ascent and Descent configurations, both of which are suitable for mid-span or end - span changes of direction.

VANTRUNK

SECTION 07:

ENGINEERING DATA

This collection of Engineering Data is intended to supply essential technical information relating to Vantrunk's Cable Management Systems. Its aim is to ensure that the specified Cable Management installation is adequately protected against corrosion and has suitable strength & rigidity to provide reliable support at minimum installed cost.

Our Technical Team is available to answer any questions relating to particular site requirements which may not be answered in the following sections.

Contact our team here: eddy.current@vantrunk.co.uk

1. SPEEDWAY CABLE LADDER

1.1 General Information

1.1.1 Slot Patterns

Details of the slot patterns for the Speedway cable ladder system are given in the following diagrams. These slot patterns are common for each Speedway cable ladder type, irrespective of material gauge.

| | |
|--|--|
| <p>Speedway SW4 Straight Ladder</p>  <p>T = Side Wall Gauge (See section 1.1.2 for details).</p> | <p>Speedway SW4 Fittings</p>  <p>The slot pattern for the Speedway SW4 fittings is repeated at each end of the fitting side wall and centrally on radial side walls (elbows, tees & crosses).</p> |
| <p>Speedway SW5 Straight Ladder</p>  <p>T = Side Wall Gauge (See section 1.1.2 for details).</p> | <p>Speedway SW5 Fittings</p>  <p>The slot pattern for the Speedway SW5 fittings is repeated at each end of the fitting side wall and centrally on radial side walls (elbows, tees & crosses).</p> |
| <p>Speedway SW6 Straight Ladder</p>  <p>T = Side Wall Gauge (See section 1.1.2 for details).</p> | <p>Speedway SW6 Fittings</p>  <p>The slot pattern for the Speedway SW6 fittings is repeated at each end of the fitting side wall and centrally on radial side walls (elbows, tees & crosses).</p> |

Speedway Rung

11.2 Standard Material Gauges

The gauges for the standard Speedway cable ladder & fittings have been determined by providing the most cost effective and efficient combination of material gauges for the side walls and rungs to suit the designed application of each type of Speedway cable ladder system.

The following table shows the standard material gauges for the Speedway cable ladder system in Hot Dipped Galvanised Structural Steel (GY). These gauges are supplied as standard unless otherwise specified.

Standard Galvanised Gauges

| Finish & Material | Ladder Type | Side Wall Gauge | Rung Gauge | | | | | | |
|-------------------|--------------|-----------------|------------|--------|--------|--------|--------|--------|---------|
| | | | 150 mm | 300 mm | 450 mm | 600 mm | 750 mm | 900 mm | 1050 mm |
| GY | Speedway SW4 | 1.5mm | 1.5mm | | | | | | |
| | Speedway SW5 | 1.5mm | | | | | | | |
| | Speedway SW6 | 2mm | 2mm | | | | | | |

The Speedway cable ladder system is available in a combination of side wall gauges (1.5mm & 2.0mm) and rung gauges (1.5mm, 2.0mm & 2.5mm) to suit specific installation requirements.

Consult our Technical Team for guidance on the correct selection of material gauge combinations.

Weights, where provided are for the Hot Dipped Galvanised Mild Steel item. The following correction factor should be used to determine the approximate weight for the corresponding item in an alternative Finish and Material. For exact weights please contact our Technical Team.

| Material Correction Factor | | |
|---|----|-----------------------|
| Hot Dipped Galvanised Silicon Rich Steel | GX | Stainless Steel Ss |
| 1.06 | | 0.95 |

11.3 Free Base Area

Speedway straight cable ladder has the following free base area (FBA):

| Ladder Type | Free Base Area | Classification to BS EN ISO 61537 |
|--------------|----------------|-----------------------------------|
| Speedway SW4 | 86.5% | Y |
| Speedway SW5 | | |
| Speedway SW6 | | |

11.4 Cross Sectional Area

Speedway cable ladder has the following cross-sectional area (CSA):

| Speedway SW4 Ladder | CSA mm ² | Speedway SW5 Ladder | CSA mm ² | Speedway SW6 Ladder | CSA mm ² |
|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|
| SW4-SL-150-# | 13780 | SW5-SL-150-# | 15975 | SW6-SL-150-# | 20075 |
| SW4-SL-300-# | 26740 | SW5-SL-300-# | 30975 | SW6-SL-300-# | 38825 |
| SW4-SL-450-# | 39700 | SW5-SL-450-# | 45975 | SW6-SL-450-# | 57575 |
| SW4-SL-600-# | 52660 | SW5-SL-600-# | 60975 | SW6-SL-600-# | 76325 |
| SW4-SL-750-# | 65620 | SW5-SL-750-# | 75975 | SW6-SL-750-# | 95075 |
| SW4-SL-900-# | 78580 | SW5-SL-900-# | 75975 | SW6-SL-900-# | 113825 |

Add Finish & Material.

1.1.5 Speedway Cable Ladder Specification

The following is a typical specification for a cable ladder system which embodies the key features of the Speedway Cable Ladder System:

1. The cable ladder system shall be based on two longitudinal outward facing side members (sidewalls) with return edge flanges to improve safety during handling, installation and cable pulling activities. The longitudinal side members shall form the main structural elements of the cable ladder system and shall be longitudinally ribbed for enhanced stiffness and rigidity
2. The profile of the side members shall remain constant for the straight cable ladder and the cable ladder fittings
3. The profile of the side members shall present a smooth surface to allow for easier cable pulling and to minimise the opportunities for damage to the cable insulation
4. The longitudinal side members shall have a height of:
 - Speedway SW4 = 110mm and a flange width of 25mm
 - Speedway SW5 = 125mm and a flange width of 25mm
 - Speedway SW6 = 150mm and a flange width of 25mm
5. The longitudinal side member shall have a wall thickness of:
 - 1.5mm*
 - 2.0mm*

* Actual side member thickness is dependent on the projects exact requirements, please speak to our Sales Team for details
6. The side members of the straight cable ladder shall be fully slotted to minimise weight. The slot pattern in the side members shall allow for cutting of the straight cable ladder at any point along the length without the need to drill the side member when connecting to adjacent straight cable ladder and cable ladder fittings using the standard means of coupling
7. The two longitudinal side members shall be connected by individual transverse members

(rungs) which shall be welded at the lowest point of the inside face of the side members to give a loading depth of:

- Speedway SW4 = 85mm
 - Speedway SW5 = 100mm
 - Speedway SW6 = 125mm
8. The transverse members shall be evenly spaced at 300mm centres along the length of the straight cable ladder. The transverse members for horizontal bends (flat elbows) shall be located at either 0° or 7.5° and multiples there of around the fitting subject to a maximum spacing of 465mm between adjacent transverse members when measured as a linear distance along the outside face of the horizontal bend. The transverse members for horizontal intersection fittings (tees and crosses) shall be evenly spaced at intervals not exceeding 465mm. The transverse members for vertical bends (inside and outside risers) shall be evenly spaced at intervals not exceeding 300mm centres
 9. The transverse members shall be of channel profile with a width of 41mm and a height of 21mm. The transverse members shall have a continuous open slot to suit the mounting of cable restraint devices (cleats, etc.) and other equipment using standard channel nuts and fixings. The base of the transverse members shall have slots of size 18mm x 11mm at 25mm centres to suit the use of cable ties and banding
 10. The transverse members (rung) shall have a wall thickness of:
 - 1.5mm*
 - 2.0mm*
 - 2.5mm*

* Actual rung thickness is dependent on the projects exact requirements, please speak to our Sales Team for details
 11. The transverse members for straight cable ladder shall be orientated with the continuous slot facing alternately upwards and downwards. The transverse members for cable ladder fittings shall be orientated with the continuous slot facing upwards to allow for the securing of cable restraint devices (cleats, etc.) at every rung position

12. The width of the straight cable ladder and the cable ladder fittings shall be measured relative to the inside faces of the side members. The widths of the straight cable ladder and cable ladder fittings shall be 150mm, 300mm, 450mm, 600mm, 750mm, 900mm & 1050mm
13. The straight cable ladder shall have a length of 3000mm or 6000mm as specified
14. The cable ladder fittings shall have fixed angles of 90°, 60°, 45° and 30°
15. Radial cable ladder fittings shall have a radius of 300mm, 450mm, 600mm, 750mm, 900mm, 1050mm & 1200mm. The radius of the fitting shall be measured relative to the inside face on the radial side wall
16. The cable ladder system shall be manufactured using:
 - **Hot Dipped Galvanised Structural Steel:** structural steel of a grade to BS EN 10025-2 and shall be hot dip galvanised up to a maximum average coating thickness of 85µm after manufacture to BS EN ISO 1461
 - **Deep Galvanised Structural Steel:** structural steel of a grade to BS EN 10025-2 and shall be deep galvanised up to a maximum average coating
- thickness of 120µm after manufacture to BS EN ISO 1461
- **Deep Galvanised Silicon Rich Structural Steel:** silicon-rich steel (generally complying of a grade to BS EN 10025) and deep galvanised up to a maximum average coating thickness of 160µm after manufacture to BS EN ISO 1461.
- **Hot Dipped Galvanised Carbon Steel:** low carbon steel of a grade to BS EN 10111 or equivalent and shall be hot dip galvanised to 55µm after manufacture to BS EN ISO 1461
- **Marine Grade Stainless Steel:** stainless steel grade 1.4404 (316L marine grade) to BS EN 10088
17. The couplers shall be profiled to match the profile of the cable ladder. The couplers shall be secured using M10 square-shouldered bolts with rounded heads. The bolts shall be secured with M10 serrated flanged nuts as standard. The couplers shall have a slot pattern which greatly reduces slip between adjacent straight ladder lengths (including cut lengths of straight cable ladder) and between cable ladder fittings. The couplers shall have a slot pattern which allows for easy connection to cut lengths of straight cable ladder without the need for on - site drilling

1.2 Installation

1.2.1 Loads

A correctly designed and specified cable ladder installation should take into account the nature and extent of the loads which will be imposed on the cable ladder system. These loads comprise of dead loads including the self-weight of the cable ladder system, the weight of the cables and secondary equipment attached to the cable ladder, imposed loads which occur during installation of the cable ladder system and during cable pulling operations, and external loads such as wind, snow & ice.

Cable ladders are often employed in locations where the wind speeds may cause considerable lateral loading and careful consideration must be given to design to ensure a satisfactory installation. An awareness of the worst possible climate conditions is necessary when specifying the correct Speedway cable ladder system.

The load-deflection information given in section 1.3.3 is based on static loading of the Speedway cable ladder installation and does not take into account dynamic effects such as wind, etc.

In designing a cable ladder installation it is good practice to allow at least a 20% excess capacity in a new installation for future expansion. Such a provision is of great economic advantage when there is a later need for additional cables.

1.2.2 Support Spacing

The space between the supports of a cable ladder installation is referred to as the span. Supports for cable ladder should, as far as practicable, be spaced so as to create the most economical load-span ratio to suit the capacity of the cable ladder system.

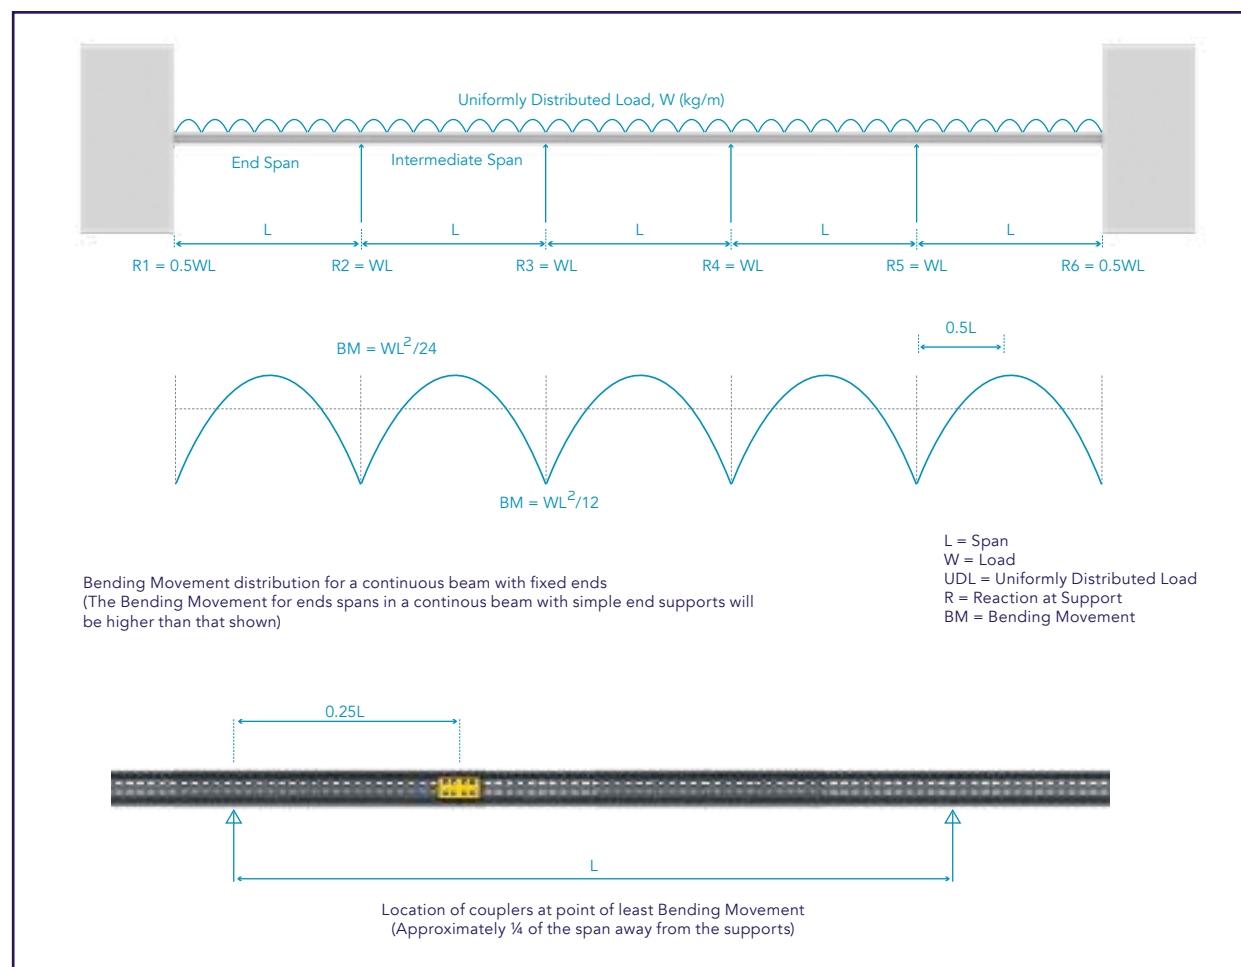

This will give the most advantageous solution when considering procurement and installation costs. As a general rule of thumb, the load-carrying capability of the Speedway Cable Ladder system increases as the span decreases, so a lighter duty cable ladder system can be specified for shorter spans. Conversely, a heavier duty Speedway Cable Ladder system will need to be specified for longer spans.

When considering support positions it should be remembered that it is necessary to support accessories when a change of direction takes place i.e. bends, tees, risers etc. This is to ensure that undue 'corner' cantilever reaction is minimised. Recommendations for the location of supports for Speedway Cable Ladder fittings are given in section 1.2.4.

1.2.3 Location of Couplers

The maximum bending moments acting on a cable ladder run occur in the cable ladder side members at the supports and at the mid span position. For this reason it is good practice to avoid locating couplers in a cable ladder run either directly on supports or at the mid span position. It is also good practice to avoid locating couplers in the end span of a continuous beam installation as the bending moments in the end span are, for simple end support installations, much higher than those found in the intermediate spans.

These limitations cannot always be achieved in a cable ladder installation and are not a mandatory requirement for the Speedway coupling system. The ideal positions to locate the couplers in a cable ladder run are at approximately a quarter of a span from the supports where the bending moment, and hence the stress, is minimal. Positioning the couplers at the quarter span positions is of benefit during installation, assisting in alignment of the cable ladders and allowing unhindered securing of the cable ladder to the supports.

1.2.4 Support Locations for Speedway Fittings

The following illustrations show the recommended support positions when installing Speedway cable ladder fittings. The supports should be fully fixed to

provide maximum support for the Speedway cable ladder fitting.

For more specific recommendations relating to particular site installations please contact our Technical Team.

Speedway Flat Elbows

Speedway 30° Flat Elbows

For 30° flat elbows, supports should be placed within 600mm of the end of the flat elbow. For 30° flat elbows with radii of 450mm and above, an intermediate support should be located radially at 15° under the flat elbow.

Speedway 60° Flat Elbows

For 60° flat elbows, supports should be placed within 600mm of the end of the flat elbow. An intermediate support should be located radially at 30° under the flat elbow.

Speedway 45° Flat Elbows

For 45° flat elbows, supports should be placed within 600mm of the end of the flat elbow. For 45° flat elbows with radii of 450mm and above, an intermediate support should be located radially at 22.5° under the flat elbow.

Speedway 90° Flat Elbows

For 90° flat elbows, supports should be placed within 600mm of the end of the flat elbow. An intermediate support should be located radially at 45° under the flat elbow.

Speedway Inside & Outside Risers

Speedway Inside Risers (all angles)

For inside risers (30°, 45°, 60° & 90°) supports should be placed within 600mm of the end of the inside riser.

Speedway Outside Risers (all angles)

For inside risers (30°, 45°, 60° & 90°) supports should be placed within 600mm of the end of the inside riser.

Speedway Inside & Outside Risers in Offset Arrangement

For inside & outside risers (30°, 45°, 60° & 90°) forming an offset of length up to 1800mm, supports should be placed within 600mm of the end of the offset and centrally on the inclined cable ladder.

For inside & outside risers (30°, 45°, 60° & 90°) forming an offset of length over 1800mm, supports should be placed within 600mm of the ends of the inside & outside risers. The inclined cable ladder should be supported in accordance with the support recommendations for a straight cable ladder run.

Speedway Equal & Unequal Tees

Speedway Equal & Unequal Tees (300mm Radius)

For equal and unequal tees with radii of 300mm, supports should be located within 300mm of the tee on each branch in the cable ladder run.

Speedway Equal & Unequal Tees (450mm Radius & Above)

For equal and unequal tees with radii of 450mm and above, supports should be located within 600mm of the tee on each branch in the cable ladder run.

Intermediate supports should be placed at approximately 2-3 of the radius (R) on each branch of the tee as shown.

Speedway Crosses

Speedway Crosses (300mm Radius)

For crosses with radii of 300mm, supports should be located within 300mm of the cross on each branch in the cable ladder run.

Speedway Crosses (450mm Radius & Above)

For crosses with radii of 450mm and above, supports should be located within 600mm of the tee on each branch in the cable ladder run.

Intermediate supports should be placed at approximately 2-3 of the radius (R) on each branch of the cross as shown.

Speedway Reducers

For all widths of straight reducer, left-hand reducer, and right-hand reducer, supports should be located on the cable ladder run within 600mm of the reducer as shown.

Speedway Right-Hand Reducer

Speedway Left-Hand Reducer

Speedway Straight Reducer

Where cantilevers of additional length are used to support Speedway cable ladder, care should be taken to position the cable ladder as close to the backplate of the cantilever as the installation routing will allow.

Where the Speedway cable ladder is not filled to capacity, or is carrying heavy cables, care should be taken to position the cables as close to the cantilever backplate as the installation routing will allow.

For those installations where the routing of the cable ladder or the position of heavy cable loads cannot be undertaken in accordance with the above, the IC-PROP-Size cantilever arm prop should be used to correctly support the cantilever arm.

More details on the Safe Working Load of Speedway supports can be found in the Supports Section.

For further information and guidance on the loading of supports please contact our Technical Team.

Avoid locating cable ladder on the end of cantilever support

Locate cable ladder close to the cantilever backplate

Avoid placing unsymmetrical cable loads on the extremes of cantilever supports

Locate unsymmetrical cable loads close to the cantilever backplate

Use the cantilever prop (IC-PROP-Size – See page 177) to support offset cable ladder or unsymmetrical cable loads.

1.2.5 Loading of Supports

It is important that cable ladder and cable ladder supports are loaded in a symmetrical manner such that undue stresses are kept to a minimum.

The safe working load figures for the Speedway cable ladder and the Speedway cantilever type supports is based on a uniform loading within the Speedway cable ladder and on the assumption that the correct length of cantilever is used in each case.

1.2.6 Electrical Continuity Characteristics

In tests conducted to verify the electrical continuity characteristics of the Speedway cable ladder it has been established that the standard Speedway coupling system provides adequate electrical continuity, ensuring equipotential bonding and connection to earth.

The Speedway cable ladder system has been tested for electrical continuity to BS EN 61537 (Section 11.1). Details are given in the following table.

| Ladder Type | Material & Finish | Impedance across joint | Impedance per metre length |
|--------------|--------------------|------------------------|----------------------------|
| Speedway SW4 | Hot Dip Galvanised | <50mΩ | <5mΩ |
| | Stainless Steel | | |
| Speedway SW5 | Hot Dip Galvanised | | |
| | Stainless Steel | | |
| Speedway SW6 | Hot Dip Galvanised | | |
| | Stainless Steel | | |

BS EN 61537 requires a maximum impedance of 50mΩ across the coupled joint and 5mΩ per metre length without a joint

The electrical continuity of the Speedway cable ladder joints has been tested to NEMA VE (Section 5.1). Details are given in the following table.

| Ladder Type | Material & Finish | Resistance across joint |
|--------------|--------------------|-------------------------|
| Speedway SW4 | Hot Dip Galvanised | <33mΩ |
| | Stainless Steel* | |
| Speedway SW5 | Hot Dip Galvanised | |
| | Stainless Steel* | |
| Speedway SW6 | Hot Dip Galvanised | |
| | Stainless Steel | |

NEMA VE 1 requires a net resistance of no more than 33mΩ across the coupled joint. * Requires use of earth bonding strap EBS01

Earth continuity bonding straps (part number EBS-01) of cross sectional area 16 mm² are available for use with Speedway cable ladder where a non-conductive surface finish i.e. epoxy coated etc, has been specified or where the installation requires an additional means of bonding.

1.2.7 Electromagnetic Compatibility (EMC)

In normal use Speedway cable ladder can be considered to be passive in respect of electromagnetic influences, emission and immunity. When Speedway cable ladder is installed as part of a wiring installation, the installation may emit or may be influenced by electromagnetic signals. The degree of influence will depend on the nature of the installation within its operating environment and the electrical equipment connected by the wiring. As a minimum precaution to minimise the occurrence of electromagnetic influences, power and data-signal cables should be run on separate cable routings or at least separated by means of dividers.

Our Technical Team should be consulted for further information on electromagnetic compatibility issues.

1.2.8 Assembly Recommendations

Instructions for the correct assembly of Speedway straight couplers and expansion couplers are given below.

Speedway Straight Couplers

The Speedway straight couplers are supplied with the correct number of fixing sets (4 for Speedway SW4 and 8 for Speedway SW5 & SW6), each comprising of an M10 x 20 square shouldered bolt and an M10 serrated flanged nut.

- 1 Locate the Speedway straight coupler on the outside of the two abutting components of the Speedway cable ladder installation (ladder to ladder) with the profile of the straight coupler aligned to the central ribbed profile on the abutting components.
- 2 Position the Speedway straight coupler over the two components such that a series of square apertures are created by the alignment of the slot patterns in the coupler and the slot patterns in the two abutting components. For joints between uncut Speedway cable ladders, the straight coupler should sit centrally across the joint. For connecting cut sections of Speedway cable ladder it may be necessary to reposition the coupler to create the series of square apertures.

- 3 Insert an M10x20 square shouldered bolt into one of the square apertures from the inside of the Speedway cable ladder with the threaded portion of the bolt protruding

- 4 Fit an M10 Serrated Flange Nut onto the threaded portion of the bolt.
- 5 Tighten the fixing assembly by hand.
- 6 Repeat for the remaining fixing sets.
- 7 Fully secure the abutting components to the supporting structure.
- 8 Check the alignment of the Speedway straight coupler and the abutting components and adjust as necessary to give a fair and true alignment.
- 9 Tighten the hex nuts on the Speedway straight coupler to a torque of 46Nm.

Speedway Integral Coupler Assembly

Speedlok Speedway Fittings are supplied with the correct number of fixing sets for that type of fitting, each comprising of an M10 x 20 square shouldered bolt, an M10 serrated flange nut.

- 1 Position the Straight Length of Speedway Cable Ladder on the inside of the Integral Couplers of the Speedway fitting with the Integral Coupler lying over the web of the Speedway profile.
- 2 Position the Speedway Integral Coupler so that a series of square apertures are created by the alignment of the slot patterns in the coupler and the straight ladder.
- 3 Insert an M10 x 20 square shouldered bolt into one of the square apertures from the inside of the Speedway cable ladder with the threaded portion of the bolt protruding through the side wall of the ladder and the Speedway Integral Coupler.

- 4 Fit an M10 Serrated Flange Nut onto the threaded portion of the bolt.

- 5 Tighten the fixing assembly by hand.
- 6 Repeat for the remaining fixing sets.
- 7 Fully secure the abutting components to the supporting structure.
- 8 Check the alignment of the Speedway Integral Coupler and the abutting components and adjust as necessary to give a fair and true alignment.
- 9 Tighten the flange nuts on the Speedway straight coupler to a torque of 46Nm.

Speedway Expansion Couplers

The Speedway expansion couplers are supplied with 8 fixing sets, each comprising of an M10 x 25 square shouldered bolt, an M12 flat washer, an M10 shake-proof washer and 2 M10 hex nuts. Refer to page 246 for details on the spacing between expansion couplers and the required gap setting procedure at the time of installation.

- 1 Locate the Speedway expansion coupler on the outside of the two abutting Speedway cable ladders with the profile of the expansion coupler aligned to the central ribbed profile on the Speedway cable ladders. NOTE: the expansion coupler should not be used to connect cut sections of cable ladder.
- 2 Position the Speedway expansion coupler equally over the two abutting Speedway cable ladders such that a series of square apertures are created by the alignment of the slot pattern in the coupler and the slot pattern in the cable ladders.
- 3 Insert an M10 x 25 square shouldered bolt into one of the square apertures from the inside of the Speedway cable ladder with the threaded portion of the bolt protruding through the Speedway cable ladder and the Speedway expansion coupler.

- 4 Fit a M12 flat washer and a M10 hex nut onto the threaded portion of the M10x25 bolt.
- 5 Tighten the fixing assembly by hand such that it is free to move within the slots of the Speedway cable ladder and the Speedway expansion coupler (some light resistance to movement is preferable).
- 6 Repeat for the remaining fixing sets.
- 7 Check the alignment of the Speedway expansion coupler and the Speedway cable ladders and adjust as necessary to give a fair and true alignment.
- 8 Check the setting gap (See page 246)
- 9 Secure the Speedway cable ladders to the supporting structure using external flange clamps

SW-EFC See Page 73) and nylon spacer pads (PAD See Page 200).

- 10 Fit a second M10 hex nut onto each of the hand tightened assemblies. Using a M10 spanner to hold the first M10 hex nut in place, tighten the second M10 hex nut to a torque of 46Nm. Check that the completed assembly is free to move (some light resistance to movement is preferable).

- 11 Repeat for the remaining fixing sets.

- 12 Check the installed Speedway expansion coupler for freedom of movement (some light resistance to movement is preferable).

Consult our Technical Team for installation instructions for the Speedway full moment expansion coupler.

1.3 Loading Information

To enable the selection of the most appropriate Speedway cable ladder for a particular installation it is necessary to consider the loads which must be supported and the distance between supports (the span). These loads are broadly classed as dead loads, imposed loads and point loads.

1.3.1 Dead Loads

Dead loads include the weight of any cables, pipes and secondary equipment carried on or installed on the cable ladder plus the self weight of the cable ladder and any component of the cable ladder (covers, connectors, accessories, etc.).

Weight data for cables is readily available from the cable manufacturer or supplier and is usually quoted in terms of kilograms per metre (kg/m). The weight per metre from the cables (or pipes, etc) is the sum of the individual cable (or pipe, etc) weights. Weight data for secondary equipment should also be readily available from the equipment manufacturer or supplier and is usually quoted in terms of kilograms (kg). The unit weight for the secondary equipment can be converted into a equivalent weight per metre by using the following formula:

$$\text{Equivalent weight per metre } W_m \text{ (kg/m)} = \frac{2 \times \text{unit of equipment (kg)}}{\text{Span (m)}}$$

For example, a secondary item of equipment with a weight of 12kg has an equivalent weight per metre W_m of 8kg/m for a span of 3m. This figure should be added to the sum of the individual cable weights (or pipe, etc). When determining the location of secondary items of equipment, care should be taken to either mount these items centrally across the cable ladder using the Speedway mounting plates, or place these items adjacent to, or directly onto, the cable ladder side members and as close to the cable ladder supports as the installation will allow.

The allowable loading figures given in the tables overleaf include the self weight of the Speedway cable ladder. The weight data for additional installed components (covers, mounting accessories, etc) for the Speedway cable ladder system can be provided on request by our Technical Team.

1.3.2 Point Loads

Point loads are often applied to the cable ladder during installation, cable pulling and in-service inspection.

An allowance can be made for the influence of point loads at the design stage when determining the total load to be carried by the Speedway cable ladder system. Typical point loads are in the order of 75kg to 150kg. When specifying a point load requirement it should be noted that the value of the point load should be kept to a minimum as incorporating the point load will reduce the allowable cable load for the Speedway cable ladder. Loading graphs which include the influence of a mid span point load are available on request.

Speedway cable ladder is not intended to be used as

a walkway and on no account should point loads be applied to the rungs. On those occasions where it is necessary to apply a point load care should be taken to apply the load evenly onto the two side members, preferably using a board or similar support to distribute the load over as long a section of the cable ladder as possible.

Correct application of point load onto Speedway cable ladder using a board to spread the load evenly onto the side members

1.3.3 Safe Working Load

When correctly mounted and secured, cable ladder can be considered to be a 'continuous beam'. This implies that the cable ladder run is regularly supported and that the cable ladders at the extremities of the run are firmly anchored. The following tables are used to calculate the safe working load and have been verified by testing in accordance to BS EN 61537. The load bearing capacity of a cable ladder is limited by the lesser of the maximum allowable stress induced in the side members and rungs or the maximum deflection acceptable in the same members. The maximum allowable stress is usually limited by the materials lower yield stress; this gives a safety factor of 1.7 against the ultimate tensile strength.

Maximum deflection, (in the absence of a particular customer need) is not allowed to exceed 1/100th of the distance between supports (span) longitudinally or 1/20th of the rung length (cable ladder width) transversely. Although unusual, there may be

occasions when it is difficult or indeed impossible to anchor the cable ladder securely in position. Under these circumstances the ladder is 'simply supported' and its load bearing ability is substantially reduced. As a rough guide maximum loads should be limited to two thirds of those shown in the loading tables and increased deflection values should be accepted for each span.

The data given in the tables is for Vantrunk cable ladder installed as a continuous beam and allows for the weight of the ladder itself. The safe working load values represent a uniformly distributed load and a factor of 1.7 as recommended in the cable ladder European standard. This information is given for guidance only and larger safety factors can be used depending on the installation. The Speedway Cable Ladder system, components and accessories have been tested to BS EN ISO 61537.

Further details can be provided by our Technical Team.

| Ladder Type | 3m | | 4m | | 5m | | 6m | |
|--------------|------|------|------|------|------|------|------|------|
| | kg/m | N/m | kg/m | N/m | kg/m | N/m | kg/m | N/m |
| Speedway SW4 | 256 | 2511 | 175 | 1717 | 61 | 598 | 44 | 432 |
| Speedway SW5 | 306 | 3002 | 206 | 2021 | 98 | 961 | 72 | 706 |
| Speedway SW6 | 488 | 4787 | 295 | 2894 | 163 | 1599 | 129 | 1265 |

Loading data in Accordance with BS EN IEC 61537
Test Type II with a 0.75L end span.

2. VANTRUNK CABLE TRAY

2.1 General Information

2.1.1 Slot Patterns

Details of the slot patterns for the Vantrunk cable tray system are given in the following diagram. These slot patterns are common for each Vantrunk cable tray type, irrespective of material gauge and finish.

2.1.2 Profiles

2.1.3 Side Wall Heights

The Vantrunk cable tray range is available with the following side wall heights.

| Tray & Fitting Type | Side Wall Height mm |
|---------------------------|---------------------|
| Medium Duty Return Flange | 25 |
| | 50 |
| Heavy Duty Return Flange | 75 |
| | 100 |

2.1.4 Cable Tray Fitting Radius

Vantrunk cable tray fittings are available with the following standard radii.

Standard Radius For Cable Tray Fittings

| Tray Width (mm) | Flat Elbows, Tees & Crosses | Inside & Outside Risers |
|-----------------|-----------------------------|-------------------------|
| 50 | 75 | 300 |
| 75 | | |
| 100 | | |
| 150 | | |
| 200 | 150 | |
| 225 | | |
| 300 | | |
| 450 | | |
| 600 | | |
| 750 | | |
| 900 | | |

All Vantrunk cable tray fittings are available to order with radii of 300mm, 450mm & 600mm. Those cable tray fittings which have a standard radius of 75mm are also available to order with a radius of 150mm. Consult our Sales Team for details.

2.1.5 Material Gauges

The standard range of material gauges for the Vantrunk cable tray & fittings have been determined by providing the most cost effective and efficient gauge for each material type to suit the designed application of each of Vantrunk cable tray system types.

Straight Lengths

| | Medium Duty | | | | Heavy Duty | | | |
|-----|-------------|-------|-------|-------|------------|-------|-------|----|
| | GA | SS | GX | GW | GA | SS | GX | GW |
| 50 | 0.9mm | 1.0mm | 1.5mm | | 0.9mm | 1.0mm | 1.5mm | |
| 75 | | | | | | | | |
| 100 | | | | | | | | |
| 150 | | | | | | | | |
| 200 | | | | | | | | |
| 225 | 1.2mm | | | | 1.2mm | | | |
| 300 | | | | | | | | |
| 400 | 1.5mm | 1.5mm | | | 1.5mm | 1.5mm | | |
| 450 | | | | | | | | |
| 600 | 2.0mm | | 2.0mm | 2.0mm | | | 2.0mm | |
| 750 | | | | | | | | |
| 900 | | | | | | | | |

Fittings

| | Medium Duty | | | | Heavy Duty | | | |
|-----|-------------|-------|-------|-------|------------|-------|-------|----|
| | GA | SS | GX | GW | GA | SS | GX | GW |
| 50 | 0.9mm | 1.0mm | 1.5mm | | 0.9mm | 1.0mm | 1.5mm | |
| 75 | | | | | | | | |
| 100 | | | | | | | | |
| 150 | | | | | | | | |
| 200 | | | | | | | | |
| 225 | 1.2mm | | | | 1.2mm | | | |
| 300 | | | | | | | | |
| 400 | 1.5mm | 1.5mm | | | 1.5mm | 1.5mm | | |
| 450 | | | | | | | | |
| 600 | 2.0mm | | 2.0mm | 2.0mm | | | 2.0mm | |
| 750 | | | | | | | | |
| 900 | | | | | | | | |

Covers

| | GA | SS | GX | GW |
|-----|-------|-------|-------|----|
| 50 | 0.9mm | 1.0mm | 1.5mm | |
| 75 | | | | |
| 100 | | | | |
| 150 | | | | |
| 200 | | | | |
| 225 | 1.2mm | | | |
| 300 | | | | |
| 400 | 1.5mm | 1.5mm | | |
| 450 | | | | |
| 600 | 2.0mm | | 2.0mm | |
| 750 | | | | |
| 900 | | | | |

The following table shows the standard material gauges for each width and type of Vantrunk cable tray system in a number of finishes. Consult our Technical Team for gauge details for other materials & finishes.

The standard material gauges are supplied for each tray and fitting type & width unless otherwise specified.

Consult our Technical Team for guidance on the appropriate selection of non-standard material gauges. Weights, where quoted in the catalogue, are for the standard hot dip galvanised carbon steel item. The following correction factors should be used to determine an estimated weight for the corresponding item in an alternative gauge and finish. For exact weight data please consult our Sales Team.

As an example:

A heavy duty return flange cable 90° flat bend, 300mm wide, hot dip galvanised finish in standard 1.2mm gauge weighs 2.32kg. The equivalent weight of the stainless steel item in 1.5mm gauge = 2.32kg x 1.2 = 2.78kg.

Material & Gauge Correction Factor

| Standard Gauge | Required Gauge | Hot Dip Galvanised Mild Steel (GA) | Stainless Steel (SS) | Hot Dip Galvanised Silicon Rich Steel (GX) |
|----------------|----------------|------------------------------------|----------------------|--|
| 0.9 | 0.9 | 0.92 | 0.94 | 1.08 |
| | 1.0 | 1.02 | 1.04 | 1.20 |
| | 1.2 | 1.24 | 1.26 | 1.42 |
| | 1.5 | 1.58 | 1.60 | 1.76 |
| | 2.0 | 2.10 | 2.13 | 2.35 |
| 1.0 | 0.9 | 0.83 | 0.84 | 1.08 |
| | 1.0 | 0.92 | 0.94 | 1.20 |
| | 1.2 | 1.12 | 1.14 | 1.42 |
| | 1.5 | 1.42 | 1.44 | 1.76 |
| | 2.0 | 1.89 | 1.92 | 2.35 |
| 1.2 | 0.9 | 0.69 | 0.70 | 0.81 |
| | 1.0 | 0.77 | 0.78 | 0.90 |
| | 1.2 | 0.93 | 0.95 | 1.07 |
| | 1.5 | 1.18 | 1.20 | 1.32 |
| | 2.0 | 1.57 | 1.60 | 1.76 |
| 1.5 | 0.9 | 0.55 | 0.56 | 0.65 |
| | 1.0 | 0.61 | 0.62 | 0.72 |
| | 1.2 | 0.75 | 0.76 | 0.85 |
| | 1.5 | 0.95 | 0.96 | 1.05 |
| | 2.0 | 1.26 | 1.28 | 1.41 |
| 2.0 | 0.9 | 0.41 | 0.42 | 0.49 |
| | 1.0 | 0.46 | 0.47 | 0.54 |
| | 1.2 | 0.56 | 0.57 | 0.64 |
| | 1.5 | 0.71 | 0.72 | 0.79 |
| | 2.0 | 0.94 | 0.96 | 1.06 |

Consult our Technical Team for other material & gauge combinations.

2.1.6 Recommended number of fixings

Vantrunk cable tray fittings have integral jointing strips for connecting to straight lengths and for connecting cable tray fittings to cable tray fittings. The cable tray fixing set comprises of an M6 x 12 screw and an M6 nut (plus an M6 flat washer for stainless steel fixings).

Cable Tray Fixing Sets

| Part Number | Description | |
|--|---|--|
| Hot Dip Galvanised Cable Tray | | |
| M6x12-BN-GA | M6 x 12 Mushroom Head Bolt M6 Square Nut |  |
| Stainless Steel | | |
| M6x12PHS-SS-A4 M6-FW-SS-A4 M6-HN-SS-A4 | M6 x 12 Pan Head Screw M6 Flat Washer M6 Hex Nut |  |

The following table gives the recommended number of fixings for each type of cable tray straight length, fish plate coupler & cable tray fitting.

Recommended Number of Fixings for Cable Tray

| Item | Width mm | Number of Fixing Supplied | |
|-------------------------|---------------|---------------------------------------|---------|
| Straight Lengths | 50 to 150 | 0 (Fixings supplied with Couplers) | |
| | 200 | | |
| | 225 | | |
| | 300 | | |
| | 450 | | |
| | 600 | | |
| | 750 | | |
| | 900 | | |
| Fish Plate Couplers | 50 & 75 | NA | |
| | 100 & 150 | 5 | |
| | 200 | 6 | |
| | 225 | | |
| | 300 | | |
| | 450 | 8 | |
| | 600 | 10 | |
| | 750 | 12 | |
| | 900 | 16 | |

| | 200 | | |
| | 225 | 5 | |
| | 300 | | |
| | 450 | 6 | 7 |
| | 600 | 6 | 8 |
| | 750 | | |
| | 900 | | |

2.1.7 Perforation Base Area

Vantrunk straight cable tray has the following perforation base area:

Perforation Base Area for Vantrunk Cable Tray

| Tray Type | Perforation Base Area | Classification to BS EN 61537 |
|---------------------------|-----------------------|-------------------------------|
| Medium Duty Return Flange | 9.14% | B |
| Heavy Duty Return Flange | 9.14% | B |

Consult our Technical Team for perforation base area classifications for Vantrunk cable tray fittings.

The cross sectional areas given in the table above exclude return flanges where appropriate – see the following illustration for the cross section which is included as part of the area calculation.

Consult our Technical Team for cross-sectional area information for Vantrunk cable tray fittings.

2.1.8 Cross-sectional Area

The Vantrunk cable tray has the following cross-sectional areas (CSA):

Cross-sectional Area for Vantrunk Cable Tray

| Tray Type | Width | CSA mm ² |
|---------------------------|-------|---------------------|
| Medium Duty Return Flange | 50 | 1040 |
| | 75 | 1628 |
| | 100 | 2215 |
| | 150 | 3390 |
| | 200 | 4565 |
| | 225 | 5153 |
| | 300 | 6915 |
| | 450 | 10440 |
| | 600 | 13965 |
| Heavy Duty Return Flange | 750 | 17490 |
| | 900 | 21015 |
| | 50 | 2290 |
| | 75 | 3503 |
| | 100 | 4715 |
| | 150 | 7140 |
| | 200 | 9565 |
| | 225 | 10778 |
| | 300 | 14415 |
| | 450 | 21690 |
| | 600 | 28965 |
| | 750 | 36240 |
| | 900 | 43515 |

CSA information is based on standard gauges in a hot dip galvanised finish. Consult our Technical Team for other gauges and materials.

2.1.9 Vantrunk Cable Tray Specification

The following is a typical specification for a cable tray system which incorporates the key features of the Vantrunk cable tray system.

- 1 The cable tray system shall comprise a perforated base with longitudinal upward facing side walls. Medium duty and heavy duty cable tray shall have returned flanges on the side walls for improved strength.
- 2 The profile of the cable tray straight lengths shall remain constant for the straight cable tray and shall be compatible with that of the matching cable tray fittings.
- 3 The inside of the cable tray shall present a smooth surface to allow for easier cable pulling and to minimise the opportunities for damage to the cable insulation.
- 4 The cable tray side walls shall have an overall height of:

For medium duty return flange cable tray: 25mm for all tray widths.

For heavy duty return flange cable tray: 50mm (or required side wall height) for all tray widths.

- 5 The cable tray shall have a width of 50mm, 75mm, 100mm, 150mm, 200mm, 225mm, 300mm, 450mm, 600mm, 750mm and 900mm as required. The width shall be measured internally between the side walls.

- 6 The cable tray shall have a minimum thickness as follows for hot dip galvanised finish, other finishes consult our sales team:

For medium duty return flange cable tray: 0.9mm for tray of widths 50mm to 225mm, 1.2mm for tray of width 300mm (1.0mm for stainless steel), 1.5mm for tray of widths 450mm and 600mm and 2.0mm for widths of 750mm and 900mm (1.5mm for stainless steel).

For heavy duty return flange cable tray: 0.9mm for tray of widths 50mm to 150mm, 1.2mm for tray of width 200mm to 300mm (1.0mm for stainless steel), 1.5mm for tray of widths 450mm and 600mm and 2.0mm for widths of 750mm and 900mm (1.5mm for stainless steel).

For silicon rich, deep galvanised tray – all types: 1.5mm for tray of width 50mm to 600mm, 2.0mm for tray of widths 750mm to 900mm.

- 7 Straight cable tray shall be fully slotted with longitudinal slots of size 20mm x 8mm and transverse slots of size 12mm x 8mm. The slots shall be pitched at 25mm centres across the width of the cable tray and at 50mm centres along the length of the cable tray.
- 8 Straight cable tray shall have a length of 3000mm
- 9 Cable tray fittings shall be suitable slotted to match the slot pattern in the straight cable tray and shall have integral joints to facilitate connection to straight tray lengths and to other cable tray fittings.
- 10 Cable tray flat bends shall have fixed angles of 90°, 60°, 45° and 30°.
- 11 Cable tray fittings (except risers) shall have a radius of 75mm for widths up to & including 150mm, & a radius of 150mm for widths of 200mm and above. Cable tray risers shall have a radius of 300mm when formed to the set angle.

- 12 Cable tray risers shall be of an angle, 90°, 60°, 45° and 30°.

- 13 The cable tray system shall be manufactured using:

For carbon steel, hot dip galvanised finish: carbon steel to BS EN 10111 and shall be hot dip galvanised after manufacture to BS EN ISO 1461.

For stainless steel: stainless steel grade, 1.4404 (316 marine grade) to BS EN 10088.

For silicon rich, deep galvanised finish: silicon-rich steel and shall be deep galvanised after manufacture to twice the coating thickness specified by BS EN ISO 1461.

- 14 Couplers for the cable tray system shall be either of flat bar type or profiled to match the profile of the cable tray. Couplers shall be secured using M6 x 12 fixings with smooth heads to minimise possible damage to cables.

2.2 Installation Recommendations

2.2.1 Loads

A correctly designed and specified cable tray installation should take into account the nature and extent of the loads which will be imposed on the cable tray system. These loads comprise of dead loads including the self-weight of the cable tray system, the weight of the cables and secondary equipment attached to the cable tray, imposed loads which occur during installation of the cable tray system and during cable pulling operations, and external loads such as wind, snow & ice.

Cable trays are often employed in locations where the wind speeds may cause considerable lateral loading and careful consideration must be given to design to ensure a satisfactory installation. An awareness of the worst possible climate conditions is necessary when specifying the correct Vantrunk cable tray system.

The load-deflection information given in 2.3.3 is based on static loading of the Vantrunk cable tray installation. This information does not take into account dynamic effects such as vibration, earthquake loading, etc.

In designing a cable tray installation it is good practice to allow at least a 20% excess capacity in a new installation for future expansion. Such a provision is of great economic advantage when there is a later need for additional cables.

2.2.2 Support Spacing

The space between the supports of a cable tray installation is referred to as the span. Supports for cable tray should, as far is practicable, be spaced so as to create the most economical load/span ratio to suit the capacity of the cable tray system.

This will give the most advantageous solution when considering procurement and installation costs. As a general rule of thumb, the load-carrying capability of the Vantrunk cable tray system increases as the span decreases, so a lighter duty cable tray system can be specified for shorter spans. Conversely, a heavier duty Vantrunk cable tray system will need to be specified as the span increases.

Vantrunk cable tray can provide cost-effective support for cable loads at spans of 0.5m to 3m depending

on the type of cable tray system selected. For longer spans, or for carrying significantly increased cable loads, the Speedway cable ladder system should be used.

When considering support positions it should be remembered that it is necessary to support accessories when a change of direction takes place i.e. bends, tees, risers etc. This is to ensure that undue 'corner' cantilever reaction is minimised. Recommendations for the location of supports for Vantrunk cable tray fittings are given in section 2.2.4

2.2.3 Location of Couplers

The maximum bending moments acting on a cable tray run occur in the cable tray at the supports and at the mid span position. For this reason it is good practice to avoid locating couplers in a cable tray run either directly on supports or at the mid span position. It is also good practice to avoid locating couplers in the end span of a continuous beam installation as the bending moments in the end span are, for simple end support installations, much higher than those found in the intermediate spans. These limitations cannot always be achieved in a cable tray installation and are not a mandatory requirement for the Vantrunk cable tray coupling system where the loading information given in 3.3 is valid irrespective of the location of the couplers.

The ideal positions to locate the connections in a cable tray run are at approximately one fifth to one quarter of a span from the supports where the bending moments, and hence the stresses, are minimal. Positioning the couplers at the one fifth to one quarter span positions is of benefit during installation, assisting in alignment of the cable trays and allowing unhindered securing of the cable tray to the supports.

Ideal Coupler Location

Allowable Coupler Location

Inappropriate Coupler Location

2.2.4 Support Locations for Cable Tray Fittings

It is also important to consider support locations for cable tray fittings which are used as part of a cable tray installation to change direction, change width or create intersections.

Vantrunk cable tray fittings are designed to carry loads comparable to that for the straight cable tray but will require local support to avoid undue stresses being applied to the fittings.

The following illustrations show the recommended support positions when installing Vantrunk cable tray fittings. The supports should be fully fixed to provide maximum support for the Vantrunk cable tray fitting.

Flat Elbows

30° Flat Elbow

For 30° flat elbows, supports should be placed within 150mm of the fitting for widths up to 300mm. For fittings of width 450mm and above, supports should be placed within 300mm of the fitting and an intermediate support should be located radially at 15° across the centre of the fitting.

60° Flat Elbow

For 60° flat elbows, supports should be placed within 150mm of the fitting for widths up to 300mm. For fittings of width 450mm and above, supports should be placed within 300mm of the fitting and an intermediate support should be located radially at 30° across the centre of the fitting.

45° Flat Elbow

For 45° flat elbows, supports should be placed within 150mm of the fitting for widths up to 300mm. For fittings of width 450mm and above, supports should be placed within 300mm of the fitting and an intermediate support should be located radially at 22.5° across the centre of the fitting.

90° Flat Elbow

For 90° flat elbows, supports should be placed within 150mm of the fitting for widths up to 300mm. For fittings of width 450mm and above, supports should be placed within 300mm of the fitting and an intermediate support should be located radially at 45° across the centre of the fitting.

Internal & External Risers

Internal Risers

For all widths of internal risers, supports should be placed within 300mm of the fitting.

External Risers

For all widths of external risers, supports should be placed within 300mm of the fitting.

Internal & External Risers Used in Offset Arrangement

For internal & external risers used in an offset arrangement of length up to 600mm, supports should be located within 300mm of each end of the offset and centrally on the inclined cable tray.

...continued

For internal & external risers used in an offset arrangement of length over 600mm, supports should be located within 300mm of each end of the internal & external risers. The inclined cable tray should be supported in accordance with the support recommendations for the straight cable tray run.

Equal & Unequal Tees

For equal and unequal tees, supports should be placed within 150mm of the fitting for main or branch widths up to 300mm. For fittings of main or branch width 450mm and above, supports should be placed within 300mm of the fitting.

Crosses

For crosses, supports should be placed within 150mm of the fitting for main or branch widths up to 300mm. For fittings of main or branch width 450mm and above, supports should be placed within 300mm of the fitting.

2.2.5 Loading of Vantrunk Cable Tray & Supports

It is important that cable tray and cable tray supports are loaded in a symmetrical manner such that undue stresses in both the cable tray and the supports are kept to a minimum.

The safe working load figures for the Vantrunk cable tray and support accessories are based on a uniform loading within the Vantrunk cable tray and on the assumption that the correct length of support is used in each case.

Wherever possible, cable tray should be loaded in a uniform manner across the full width of the cable tray, particularly when the cable tray is loaded to the recommended load carrying capacity.

Avoid non-uniform loading

Load uniformly across the width of the cable tray

Where cantilever supports of additional length are used to support cable tray, care should be taken to position the cable tray as close to the backplate of the cantilever as the installation routing will allow.

Avoid unsymmetrical loading on cantilevers

Load cantilevers close to the backplate

Reducers

For all widths of reducers (straight, left & right), supports should be placed within 300mm of the fitting.

Safe working load information for cable tray supports is given in the 'Supports' section of this catalogue.

For further information and guidance on the design and loading of supports please contact our Technical Team.

2.2.6 Electrical Continuity Characteristics

In tests conducted to verify the electrical continuity characteristics of the Vantrunk cable tray it has been established that the standard coupling system provides adequate electrical continuity, ensuring equipotential bonding and connection to earth.

The Vantrunk cable tray system has been tested for electrical continuity to BS EN 61537 (Section 11.1).

Details are given in the following table:

| Material & Finish | Impedance across joint | Impedance per metre length |
|----------------------------|------------------------|----------------------------|
| Hot Dip Galvanised (0.9mm) | 2mΩ | 2mΩ |
| Hot Dip Galvanised (1.5mm) | 2mΩ | 2mΩ |
| Stainless Steel (1.2mm) | 2mΩ | 2mΩ |

BS EN 61357 requires a maximum impedance of 50mΩ across the coupled joint and a 5mΩ per metre length without a joint.

Earth continuity bonding straps (part number EBS-05) of cross sectional area 4 mm² are available for use with Vantrunk cable tray where a non-conductive surface finish i.e. epoxy coated etc, has been specified or where the installation requires an additional means of bonding. Consult our Technical Team for more details.

2.2.7 Electromagnetic Compatibility (EMC)

In normal use Vantrunk cable tray can be considered to be passive in respect of electromagnetic influences, emission and immunity. When Vantrunk cable tray is installed as part of a wiring installation, the installation may emit or may be influenced by electromagnetic signals. The degree of influence will depend on the nature of the installation within its operating environment and the electrical equipment connected by the wiring. As a minimum precaution to minimise the occurrence of electromagnetic influences, power and data/signal cables should be run on separate cable routings or at least separated by means of dividers.

Our Technical Team should be consulted for further information on electromagnetic compatibility issues.

2.2.8 Assembly Recommendations

Instructions for the correct assembly of Vantrunk cable tray straight lengths and fittings are given below.

Cable tray couplers are supplied with the correct number of fixing sets, each comprising of an M6 x 12 screw and an M6 nut (plus an M6 flat washer for stainless steel fixings). Refer to section 2.1.6 for details on the recommended number of fixings for cable tray fittings.

When utilising the standard flat bar coupler as an expansion coupler it will be necessary to order M6x16 bolts and additional M6 nuts (4 per coupler).

Straight Cable Tray to Straight Cable Tray

- 1 Position the two straight cable trays onto the supporting structure.
- 2 For flat bar couplers, locate the cable tray flat bar coupler on the inside of the two abutting straight cable trays. For wrap over couplers, position the coupler on the outside of the two abutting straight cable trays.
- 3 Position the coupler across the joint between the two straight lengths. For flat bar couplers, align the slots in the coupler with those in the side wall of the cable tray. For wrap over couplers, align the slots in the coupler with those in the base of the cable tray.
- 4 From the inside of the cable tray insert the threaded portion of an M6 x 12 screw through one of the aligned slots.
- 5 Fit an M6 flat washer (where provided) and an M6 hex nut onto the protruding thread of the M6 x 12 screw.
- 6 Tighten the fixing assembly by hand.
- 7 Repeat for the remaining fixing sets.
- 8 Repeat the assembly procedure for the second coupler.
- 9 Fully secure the straight cable tray lengths to the supporting structure.
- 10 Check the alignment of the coupler and the abutting straight cable trays. Adjust as necessary to give a fair and true alignment.
- 11 Tighten the M6 hex nuts to a torque of 12Nm.
- 12 Where required, fit a fish plate coupler to the underside of the joint between the two straight cable trays.

Cable Tray Fitting to Straight Cable Tray

- 1 Position the straight cable tray and cable tray fitting onto the supporting structure and interlock the cable tray fitting into the straight cable tray.
- 2 Align the slots on the interlocked straight cable tray and cable tray fitting.
- 3 From the inside of the cable tray, insert the threaded portion of an M6 x 12 screw through one of the aligned slots.
- 4 Fit an M6 flat washer (where provided) and an M6 hex nut onto the protruding thread of the M6 x 12 screw.
- 5 Tighten the fixing assembly by hand.
- 6 Repeat for the remaining fixing sets.
- 7 Fully secure the straight cable tray and cable tray fitting to the supporting structure.
- 8 Check the alignment of the interlocked straight cable tray and cable tray fitting. Adjust as necessary to give a fair and true alignment.
- 9 Tighten the M6 hex nuts to a torque of 12Nm.

Cable Tray Expansion Joint

Refer to Page 248 for details on the spacing between expansion couplers and the required gap setting procedure at the time of installation.

- 1 Position the two straight trays onto the supporting structure.
- 2 Locate the cable tray flat bar coupler on the inside of the two abutting straight cable trays.
- 3 Position the coupler across the joint between the two straight lengths. Align the slots in the coupler with those in the side wall of the cable tray.
- 4 From the inside of the cable tray insert the threaded portion of an M6 x 16 screw through one of the aligned slots.
- 5 Fit an M6 flat washer (where provided) and an M6 hex nut onto the protruding thread of the M6 x 16 screw.
- 6 Tighten the fixing assembly by hand such that the fixing assembly is free to move within the slots (some light resistance to movement is preferable).
- 7 Repeat for the remaining fixing sets.
- 8 Repeat the assembly procedure for the second coupler.
- 9 Check the alignment of the coupler and the abutting straight cable trays. Adjust as necessary to give a fair and true alignment.
- 10 Check the setting gap between the straight cable trays and adjust as necessary.
- 11 Secure the straight cable trays to the supporting structure using nylon spacer pads and hold down brackets to permit movement relative to the structure.
- 12 Fit the second M6 nut onto the fixing assemblies. Lock the second M6 nut onto the first M6 nut. Check that the completed fixing assembly remains free to move within the aligned slots.
- 13 Tighten the 2nd M6 hex nut onto the 1st M6 hex nut to a torque of 12Nm.
- 14 Ensure that the fixing assembly remains free to move within the slots, otherwise re-assembly as necessary.

2.3 Loading Information

To enable the selection of the most appropriate Vantrunk cable tray for a particular installation it is necessary to consider the loads which must be supported and the distance between supports (the span). These loads are broadly classed as dead loads, imposed loads and point loads.

2.3.1 Dead Loads

Dead loads include the weight of any cables, pipes and secondary equipment carried on or installed on the cable tray plus the self weight of the cable tray and any component of the cable tray (covers, connectors, accessories, etc.).

Weight data for cables is readily available from the cable manufacturer or supplier and is usually quoted in terms of kilograms per metre (kg/m). The weight per metre from the cables (or pipes, etc) is the sum of the individual cable (or pipe, etc) weights.

Weight data for secondary equipment should also be readily available from the equipment manufacturer or supplier and is usually quoted in terms of kilograms (kg). The unit weight for the secondary equipment can be converted into an equivalent weight per metre by using the following formula:

Equivalent weight per metre $W_m = \frac{2 \times \text{unit weight of equipment (kg)}}{\text{Span (m)}} \text{ kg/m}$

For example, a secondary item of equipment with a weight of 12kg has an equivalent weight per metre W_m of 16kg/m for a span of 1.5m. This figure should be added to the sum of the individual cable weights (or pipe, etc). When determining the location of secondary items of equipment, care should be taken to either mount these items centrally across the cable tray or place these items adjacent to, or directly onto, the cable tray side walls and as close to the cable tray supports as the installation will allow.

The allowable loading figures given in the tables below include the self weight of the Vantrunk cable tray. The weight data for additional installed components (covers, mounting accessories, etc) for the Vantrunk cable tray system can be provided on request by our Technical Team.

2.3.2 Point Loads

Point loads are often applied inadvertently to the cable tray during installation and during in-service inspection. Care should be exercised to avoid these undue point loads, particularly on light duty & medium duty cable trays which are not designed for this type of loading.

In situations where point loads are applied to heavy duty cable trays, an allowance can be made for the influence of point loads at the design stage when determining the total load to be carried by the Vantrunk cable tray system. When specifying a point load requirement at the design stage it should be noted that the value of the point load should be kept to a minimum as incorporating the point load will reduce the allowable cable load for the Vantrunk cable tray. Loading graphs which include the influence of a mid span point load are available on request.

Vantrunk cable tray is not intended to be used as a walkway and on no account should localised point loads be applied onto the bed of the cable tray. On those occasions where it is necessary to apply a point load care should be taken to apply the load evenly onto both side walls of the cable tray, preferably using a board or similar support to distribute the load over as long a section of the cable tray as possible.

Where doubt exists, further guidance should be sought from our Technical Team.

2.3.3 Loading Graphs

When correctly mounted and secured, cable tray can be considered to be a 'continuous beam'. This implies that the cable tray run is regularly supported and that the cable trays at the extremities of the run are firmly anchored. The following tables are used to calculate the safe working load and have been verified by testing in accordance to BS EN 61537.

The load bearing capacity of a cable tray is limited by the lesser of the maximum allowable stress induced in the tray section or the maximum deflection acceptable between the supports. The maximum allowable stress is usually limited by the materials lower yield stress; this gives a safety factor of 1.7 against the ultimate tensile strength. Maximum deflection, (in the absence of a particular customer need) is not allowed to exceed 1/360th of the distance between supports (span).

Although unusual, there may be occasions when it is difficult or indeed impossible to anchor the cable tray securely in position. Under these circumstances the tray is 'simply supported' and its load bearing ability is substantially reduced. As a rough guide maximum loads should be limited to two thirds of those shown in the loading tables and increased deflection values should be accepted for each span. The data given in the graphs is for tray installed as a continuous beam and allows for the weight of the tray itself.

Loading information is available for other gauges and for heavy duty cable trays with increased side wall heights – contact our Technical Team for details

The Vantrunk cable tray system, components and accessories have been tested to BS EN IEC 61537.

Further details can be provided by our Technical Team.

UDL Loading Data for Medium Duty Cable Tray GA

UDL Loading Data for Heavy Duty Cable Tray GA

3. INTELOK STEEL FRAMING

3.1 General Information

3.1.1 Slot Information

3.2 Loading Information

3.2.1 Pull Test

In order to measure the safe working pull out load (SWL) for channel, a series of tests were conducted according to BS 6946:1988. The following are the set of results that were derived from the tests.

* The Results in the table have had a safety factor of 3 applied to the ultimate failure load
* The Results are in Kilogram (Kg)

| Material | M10 | M12 |
|--------------------|------|------|
| Hot Dip Galvanised | 839 | 768 |
| Pre-Galvanised | 728 | 733 |
| Stainless Steel | 1052 | 1375 |

3.2.2 Slip Test

In order to measure the safe working slip load (SWL) for channel, a series of tests were conducted according to BS 6946:1988. The following are the set of results that were derived from the tests.

- * The Results in the table have had a safety factor of 3 applied to the ultimate failure load
- * The Results are in Kilogram (Kg)

| Material | Nut Size | Torque | 1mm Slip | Failure | Average SWL |
|--------------------|----------|--------|----------|---------|-------------|
| Hot Dip Galvanised | M10 | 46Nm | 662.6kg | 733.9kg | 286.5kg |
| Pre-Galvanised | M10 | 46Nm | 632kg | 978.6kg | 425.9kg |
| Stainless Steel | M10 | 31Nm | 336.4kg | 540.3kg | 188kg |

3.4 Classification to BS 6946:1988

The Metal Channels, Brackets and other components in this catalogue, are covered by this standard and are used to make load bearing frameworks.

For more details on the classification of the Vantrunk Steel Framing System, components and accessories to BS 6946:1988 please refer to the Vantrunk Technical Team.

3.5 Reference Standards

The following list of standards relating to Vantrunk's Cable Management products and associated support systems covered in this catalogue.

| | |
|---------------------|--|
| BS 729 | Replaced by BS EN ISO 1461 |
| BS 1449 | Part 1 Replaced by BS EN 10111, 10130 & 10025 |
| BS 1449 | Part 2 Replaced by BS EN 10088-2 |
| BS EN ISO 1461:2009 | Hot Dip Galvanised coatings on fabricated on and steel articles. Specifications and test methods (formerly BS 729) |
| BS 2989 | Replaced by BS EN 10147 |
| BS 6946:1988 | Specification for metal channel support systems for electrical installations |
| BS EN 10025:1993 | Replaced by BS EN 10025-2:2004 |
| BS EN 10025-2:2004 | Hot Rolled Products of structural steels. Technical delivery conditions for non alloy structural steels (formerly BS 10025:1993) |

| | |
|------------------|---|
| BS 10088-2:2005 | Stainless Steel. Technical Delivery conditions for sheet-plate and strip for general purposes (formerly BS 1449 Part 2) |
| BS EN 10111:2008 | Continuously hot rolled low carbon steel sheet & strip for cold forming. Technical delivery conditions |
| BS EN 10130:2006 | Cold Rolled low carbon flat products for cold forming. Technical Conditions |
| BS EN 10147:2004 | Replaced by BS EN 10136:2004 |
| BS EN 14713:2009 | Protection against corrosion of iron and steel in structures – Zinc and aluminium coatings – Guidelines |
| BS EN 10327:2009 | Continuously hot-dip coated strip & sheet of low carbon steels for cold forming. Technical Delivery Conditions |

4. GENERAL ENGINEERING DATA

4.1. Extreme Environments

4.1.1 Low Temperature Applications

Consideration should be given to the likely affects of low temperatures when specifying cable management products for installation at a location subject to sub zero temperatures.

Manufactured using generic low carbon steels and austenitic stainless steels – general guidance on the low temperature performance of these materials is as follows:

Low Carbon Steels

Low carbon steels used in the manufacture of commercially available cable management systems exhibit a ductile to brittle transition at low temperatures. At these low temperatures an impact can cause cracking which will propagate faster than the elastic deformation, resulting in failure of the product by brittle fracture. Brittle fracture can be avoided by specifying structural grade steels that have certified minimum impact values. These structural steel grades are typically certified at temperatures of 0°C, -20°C, and -40°C, showing a decreasing impact value as the temperature decreases. Vantrunk has manufactured the Speedway cable ladder system for low temperature applications using structural steels that have been independently tested at temperatures of -46°C giving average charpy values of 20 joules for 2.0mm thickness.

Austenitic Stainless Steels

Austenitic stainless steels, including grade 1:4404 to BS EN 10088-2 (marine grade 316) which is used in the manufacture of Vantrunk Cable Management systems and accessories, are not affected by sub zero temperatures. These stainless steels do not suffer a loss in either ductility or toughness and are not susceptible to failure by brittle fracture at low temperatures below -50°C. Please contact our Technical Team for further information relating to low temperature applications.

4.1.2 Expansion & Contraction

When designing and installing a cable management installation it is important to take into consideration

thermal expansion and contraction; even in relatively moderate climates there will be sufficient seasonal thermal movement which could easily place undue stresses on the cable ladder installation and the supporting structure.

To incorporate thermal movement in the design of a Cable Management System installation it is important to establish the maximum temperature differential which is likely to be encountered at the site of the installation. The temperature differential is based on the maximum and minimum seasonal temperatures. This temperature differential will determine the maximum spacing between expansion couplers within the Cable Management installation.

To facilitate correct installation of the expansion couplers it will be necessary to measure the temperature of the cable ladder at the time of installation and to use this temperature to determine the required 'setting gap' between the adjoining lengths of cable ladder and tray. This will ensure that the movement provided by the expansion coupler is not compromised by incorrect assembly at the time of installation.

Speedway Cable Ladder

The Speedway Expansion Coupler (SW-EXP) is designed to allow movement up to a maximum of 28mm and requires supporting 600mm either side of the joint.

For applications where it is not practical to support within 600mm on each side of the expansion joint, or for those installations where there is a requirement to provide an expansion coupler capable of accommodating more than 28mm of movement, the Support Reduction Expansion Coupler (SREC) should be used. The Speedway Support Reduction Expansion Coupler is capable of carrying the full load of the Speedway cable ladder at the expansion joint without the need to provide local support and can allow movement of 75mm.

In installations where an additional means of earthing or bonding is required Earth Bonding Straps (EBS-01 Page 85) should be used at expansion joints. The Speedway expansion couplers should be correctly assembled – refer to 1.2.8 for further details.

Maximum Distance between Expansion Joints

The maximum allowable spacing between expansion couplers is given in the below table for both hot dip galvanised and stainless steel Speedway Cable Ladder. Intermediate values can be obtained using the formula given under the table.

| Temperature Differential at Location of Installation | | Maximum Spacing Between Expansion Couplers | | | | | | | |
|--|-----|--|-----|-----------------|-----|-------------------------------------|------|-----------------|------|
| | | Expansion Couplers | | | | Support Reduction Expansion Coupler | | | |
| | | Hot Dip Galvanised | | Stainless Steel | | Hot Dip Galvanised | | Stainless Steel | |
| °C | °F | m | ft | m | ft | m | ft | m | ft |
| 10 | 50 | 216 | 693 | 175 | 561 | 577 | 1851 | 469 | 1505 |
| 20 | 68 | 108 | 346 | 88 | 282 | 289 | 927 | 235 | 754 |
| 30 | 86 | 72 | 231 | 59 | 189 | 193 | 619 | 157 | 504 |
| 40 | 104 | 54 | 173 | 44 | 141 | 145 | 465 | 118 | 379 |
| 50 | 122 | 44 | 141 | 35 | 112 | 116 | 372 | 94 | 302 |
| 60 | 140 | 36 | 115 | 30 | 96 | 97 | 311 | 79 | 253 |
| 70 | 158 | 31 | 99 | 25 | 80 | 83 | 266 | 67 | 215 |
| 80 | 176 | 27 | 87 | 22 | 71 | 73 | 234 | 59 | 189 |
| 90 | 194 | 24 | 77 | 20 | 64 | 65 | 209 | 53 | 170 |
| 100 | 212 | 22 | 71 | 18 | 58 | 58 | 186 | 47 | 151 |

The maximum allowable distance between expansion joints can also be calculated from the following formula:

$$D = M / [K \text{ Tdiff }]$$

Where:

D = maximum allowable distance between expansion joints (m)

M = allowable movement for each expansion joint (m)

- SW-EXP = 0.028
- SW-SREC = 0.075

K = coefficient of linear expansion of the material (°C-1)

- GY = 13×10^{-6}
- GW = 13×10^{-6}
- GX = 13×10^{-6}
- SS = 16×10^{-6}

Tdiff = temperature differential at installation site [Maximum temperature – Minimum temperature] (°C)

As an example:

For a GY ladder installation using traditional expansion couplers-

M, SW-EXP = 0.028m

K, GY = 13×10^{-6} °C-1

Maximum temperature, **Tmax** = +35°C

Minimum temperature, **Tmin** = -15°C

Therefore, **Tdiff** = (+35) – (-15) = 50°C

$$D = 0.028 / [13 \times 10^{-6} \times 50] = 44\text{m}$$

Therefore the maximum allowable distance between expansion joints is 44m, however, for ease of installation, expansion couplers should be fitted at every 14th 3m cable ladder, giving 42m between expansion couplers.

If the same installation was to use the Support Reduction Expansion Coupler instead then maximum allowable distance between expansion joints would be 116m; meaning an expansion joint would be required every 38th ladder giving 114m between SREC couplers.

If the cable ladder run was 500m in length then this would mean a saving of 44 couplers and 72 supports by using the Support Reduction Expansion Coupler instead of the traditional Expansion Coupler.

Setting Gap

Setting gap for Speedway full moment expansion coupler (CS/EXP). Supports are not required at the location of the expansion joint.

To determine the setting gap at the time of installation the following formula should be used:

$$G = [Tins - Tmax] / [Tdiff / M]$$

Where:

G = setting gap (mm)

Tins = temperature at the time of installation (°C)

Tmax = maximum temperature (°C)

Tdiff = temperature differential (°C)

M = allowable movement for each expansion joint (m)

- SW-EXP = 0.028

- SW-SREC = 0.075

Example:

Continuing the previous example -

Installation Temperature, **Tins** = +20°C

Maximum temperature, **Tmax** = +35°C

Temperature differential, **Tdiff** = 50°C

Allowable movement, **M** = 0.028

$$G = [+20 - +35] / [+50 / 0.028] = 8.4\text{mm}$$

Or for the Support Reduction Expansion Coupler = 22.5mm

Supports and Expansion Guides

If using traditional Expansion Couplers to ensure safe and correct installation, the Speedway Cable Ladder should be supported within 600mm on both sides of the expansion joint.

If using the Support Reduction Expansion Coupler (SREC), then the Speedway Cable Ladder does not need to be supported at the expansion joint.

The Speedway Cable Ladder should be fully fixed to the support nearest to the midpoint between expansion joints. At all other support positions Expansion Guides should be used, to ensure longitudinal movement.

Expansion guides (SW-EFC-EXP) comprise of a Speedway External Flange Clamp (EFC) and a nylon spacer pad, which will allow the Speedway Cable Ladder to expand and contract in a restrained manner.

Vantrunk Cable Tray

The standard flat bar coupler can allow movement up to a maximum of 14mm. This movement allowance is the basis for determining both the maximum allowable spacing between expansion joints and the required setting gap at the time of installation.

To ensure safe and correct installation, the Vantrunk Cable Tray should be supported within 300mm on each side of connections fitted with expansion couplers.

The flat bar couplers at each expansion joint should be correctly assembled – refer to 1.2 for further details. Where installed with expansion couplers, the Vantrunk Cable Tray should be secured to the supporting structure in a manner which will allow free movement.

Maximum Distance between Expansion Joints

The maximum allowable spacing between expansion joints is given in the following table for both galvanised (pre-, hot dip & deep) and stainless steel Vantrunk Cable Tray. Intermediate values can be obtained using the formula given under the table.

| Temperature Differential | | Maximum Spacing Between Expansion Couplers | | | |
|--------------------------|-----|--|-----|-----------------|-----|
| | | Hot Dip Galvanised | | Stainless Steel | |
| °C | °F | m | ft | m | ft |
| 10 | 50 | 108 | 346 | 88 | 282 |
| 20 | 68 | 54 | 173 | 44 | 141 |
| 30 | 86 | 36 | 115 | 30 | 96 |
| 40 | 104 | 27 | 87 | 22 | 71 |
| 50 | 122 | 22 | 71 | 18 | 58 |
| 60 | 140 | 18 | 58 | 15 | 48 |
| 70 | 158 | 16 | 51 | 13 | 42 |
| 80 | 176 | 14 | 45 | 11 | 35 |
| 90 | 194 | 12 | 38 | 10 | 32 |
| 100 | 212 | 11 | 35 | 9 | 29 |

The maximum allowable spacing between expansion joints can also be calculated from the following formula:

$$D = M / [K T_{diff}]$$

Where:

D = maximum allowable distance between expansion joints (m)

M = allowable movement for each expansion joint (m)

- $M = 0.014$

K = coefficient of linear expansion of the material (°C-1)

- $GX = 13 \times 10^{-6}$
- $GW = 13 \times 10^{-6}$

- $GX = 13 \times 10^{-6}$
- $SS = 16 \times 10^{-6}$

T_{diff} = temperature differential at installation site
[Maximum temperature – Minimum temperature] (°C)

As an example:

For a SS tray installation-

$$M = 0.014m$$

$$K = 16 \times 10^{-6} \text{ } ^\circ\text{C}^{-1}$$

Maximum temperature, **T_{max}** = +25°C

Minimum temperature, **T_{min}** = -5°C

Therefore, **T_{diff}** = (+25) – (-5) = 30°C

$$D = 0.014 / [16 \times 10^{-6} \times 30] = 30m$$

Therefore the maximum allowable distance between expansion joints is 30m, however, for ease of installation, expansion couplers should be fitted at every 10th 3m cable tray..

Setting Gap

Setting gap for Cable Tray Flat Bar Coupler (FBC) used as an expansion coupler.

To determine the setting gap at the time of installation the following formula should be used:

$$G = [T_{ins} - T_{max}] / [T_{diff} / M]$$

Where:

G = setting gap (mm)

T_{ins} = temperature at the time of installation (°C)

T_{max} = maximum temperature (°C)

T_{diff} = temperature differential (°C)

M = allowable movement for each expansion joint (m)

- SW-EXP = 0.028
- SW-SREC = 0.075

Example:

Continuing the previous example -

Installation Temperature, **T_{ins}** = +15°C

Maximum temperature, **T_{max}** = +25°C

Temperature differential, **T_{diff}** = 30°C

Allowable movement, **M** = 0.014

$$G = [+15 - +25] / [+30 / 0.014] = 4.7mm$$

4.1.3 Bimetallic Corrosion

Bimetallic corrosion (also referred to as galvanic or electrolytic corrosion) occurs when two dissimilar metals are in close contact with an electrolyte. An electrolyte is a medium which allows the flow of an electrical current. The presence of water as moisture can act as an electrolyte. For further details see Pages 78-79 for Speedway Insulation Assemblies and Page 127 for Cable Tray Insulation Assemblies.

The rate of corrosion depends upon the differences in electrical potential of the metals as defined by the Galvanic Series (see chart below), the strength of the electrolyte, the period for which the electrolyte is present, and the geometry of the connection between the dissimilar metals. When corrosion occurs it is the anodic metal (which is higher in the galvanic series) that will corrode in preference to the cathodic metal (which is lower in the galvanic series).

If corrosion takes place between two dissimilar metals, the metal which is higher in the galvanic series will corrode in preference to the metal which is lower in the galvanic series.

Galvanic Series Chart

It is common to find dissimilar metals such as stainless steel and low carbon steel or zinc (as found on a hot dip galvanised item) in contact in a damp atmosphere (i.e. sea water, rain, etc.).

This arrangement is typically found in coastal and offshore applications where painted structures or heavyweight galvanised steel brackets are used to support stainless steel cable ladders on the exterior of an installation.

Whilst it is possible to use a layer of paint or grease to separate the stainless steel cable ladder from a zinc

coating or any exposed low carbon steel arising from drilling of the support structure, these should not be considered as a long term means of providing electrical separation between the dissimilar metals.

The best solution is to electrically isolate the two dissimilar metals. Vantrunk cable management systems include a range of nylon pads, bushes, and washers which entirely separates the cable ladder or tray and the fixings from the support structure to prevent bimetallic corrosion.

In a typical insulating assembly the ladder or tray securing device (external flange clamp, hold down bracket, or adaptable fixing bracket), securing bolt, nut, & washer are entirely of stainless steel and are therefore compatible with the stainless steel cable ladder.

Insulating assembly for External Flange Clamp (EFC)

Insulating assembly for Hold Down Bracket (HDB)

Insulating assembly for Adaptable Fixing Bracket (AFB)

Insulating assembly for Hold Down Bracket (HDB)

4.1.4 Imposed Loads

Imposed loads include wind, ice and snow. The effects of imposed loads will vary from one installation to another and further advice relating to the specific influences of each should be sought at the design stage. The following information on imposed loads is given as a general guide only.

Ice Loads

When determining the total load to be supported by the Speedway Cable Ladder or Vantrunk Cable Tray an allowance should be made for those locations where ice formation is likely.

The tables below shows the additional load imposed by a layer of ice 10mm thick and having a density of 916kg/m³.

Ice Load (10mm thick) on Speedway Cable Ladder

| Width W mm | Ice Load kg/m | | |
|---------------|---------------|--------------|--------------|
| | Speedway SW4 | Speedway SW5 | Speedway SW6 |
| 150 | 1.72 | 1.83 | 1.83 |
| 300 | 3.10 | 3.21 | 3.21 |
| 450 | 4.47 | 4.58 | 4.58 |
| 600 | 5.84 | 5.95 | 5.95 |
| 750 | 7.22 | 7.33 | 7.33 |
| 900 | 8.59 | 8.70 | 8.70 |
| 1050 | 9.97 | 10.08 | 10.08 |

Ice Load (10mm thick) on Vantrunk Cable Tray

| Tray Width | Ice Load kg/m | |
|------------|---------------|------------|
| | Medium Duty | Heavy Duty |
| 50 | 0.46 | 0.46 |
| 75 | 0.69 | 0.69 |
| 100 | 0.92 | 0.92 |
| 150 | 1.37 | 1.37 |
| 200 | 1.83 | 1.83 |
| 225 | 2.06 | 2.06 |
| 300 | 2.75 | 2.75 |
| 450 | 4.12 | 4.12 |
| 600 | 5.50 | 5.50 |
| 750 | 6.87 | 6.87 |
| 900 | 8.24 | 8.24 |

Snow Loads

The magnitude of the additional load imposed by snow will be influenced by a number of factors including the density of the snow, the degree of drifting which will alter the profile of the snow accumulating on the Speedway Cable Ladder or Vantrunk Cable Tray, and the nature of the cable ladder installation (i.e. covers fitted or percentage of cable loading area occupied by cables). The density of snow can vary from 160kg/m³ to 481kg/m³ depending on the level of wetness and compactness. The tables below assume that the snow has a density of 160kg/m³ and is applied to a uniform height of 100mm.

Snow Load (100mm thick) on Speedway Cable Ladder

| Width W mm | Snow Load kg/m | | |
|---------------|----------------|--------------|--------------|
| | Speedway SW4 | Speedway SW5 | Speedway SW6 |
| 150 | 3.01 | 3.20 | 3.20 |
| 300 | 5.41 | 5.60 | 5.60 |
| 450 | 7.81 | 8.00 | 8.00 |
| 600 | 10.21 | 10.40 | 10.40 |
| 750 | 12.61 | 12.80 | 12.80 |
| 900 | 15.01 | 15.20 | 15.20 |
| 1050 | 17.41 | 17.60 | 17.60 |

Snow Load (100mm thick) on Vantrunk Cable Tray

| Tray Width | Snow Load kg/m | |
|------------|----------------|------------|
| | Medium Duty | Heavy Duty |
| 50 | 0.80 | 0.80 |
| 75 | 1.20 | 1.20 |
| 100 | 1.60 | 1.60 |
| 150 | 2.40 | 2.40 |
| 200 | 3.20 | 3.20 |
| 225 | 3.60 | 3.60 |
| 300 | 4.80 | 4.80 |
| 450 | 7.20 | 7.20 |
| 600 | 9.60 | 9.60 |
| 750 | 12.00 | 12.00 |
| 900 | 14.40 | 14.40 |

Wind Loads

Wind loads exert a sideways force on the cable ladder or cable tray. The sideways force is based on the wind speed and is derived from the equation $V_p \text{ (N/m}^2\text{)} = 0.6V^2$ where V is the wind speed in m/s. The wind speed will vary relative to the height above the ground and the degree of exposure. The following tables give an indication for the sideways force which will be exerted on Speedway Cable Ladder or Vantrunk Cable Tray in an exposed location at an ambient temperature of 20°C and average relative humidity for the United Kingdom.

The tabulated wind loads are based on Speedway Cable Ladder and Vantrunk Cable Tray that is installed in the horizontal plane. In this orientation the structural properties of the Vantrunk Cable Management Systems are sufficient to resist most normal wind loads. The wind loadings will be significantly higher for edge-mounted Speedway Cable Ladder and Vantrunk Cable Tray and for this reason edge-mounted ladder or tray should not be installed in areas of high wind exposure.

If covers are to be fitted to Speedway Cable Ladder or Vantrunk Cable Tray in locations subject to high wind loads further advice should be sought from our Technical Team regarding additional securing means.

Wind Loads on Speedway Cable Ladder

| Beaufort Scale | Description | Wind Speed m/s | | Pressure N/m ² | | Wind Loads - kg/m | | | | | |

4.2 Materials & Finishes

Details relating to the standard materials and finishes for Vantrunk Cable Management Systems, components, and accessories are given in the following sections. The choice of material and finish has been based on many years experience in providing cable management products and support systems for use in industrial and onshore/offshore installations.

Resistance Against Corrosion

The following table shows Vantrunk's range of standard materials and finishes and their classification for resistance against corrosion according to BS EN IEC 61537.

| Class | Reference - Material and Finish | Vantrunk Finish & Material |
|-------|--|---|
| 0 | None | |
| 1 | Electroplated to a minimum thickness of 5 mm according to ISO 2081 | |
| 2 | Electroplated to a minimum thickness of 12 mm according to ISO 2081 | |
| 3 | Pre-galvanised to grade 275 according to ISO 3575, ISO 4998 or EN 10346 |  |
| 4 | Pre-galvanised to grade 350 according to ISO 3575, ISO 4998 or EN 10346 | |
| 5 | Post-galvanised to a zinc mean coating thickness (minimum) of 45 mm according to ISO 1461 for zinc thickness only |  |
| 6 | Post-galvanised to a zinc mean coating thickness (minimum) of 55 mm according to ISO 1461 for zinc thickness only |   |
| 7 | Post-galvanised to a zinc mean coating thickness (minimum) of 70 mm according to ISO 1461 for zinc thickness only | |
| 8 | Post-galvanised to a zinc mean coating thickness (minimum) of 85 mm according to ISO 1461 for zinc thickness only (usually high silicon steel) |    |
| 9A | Stainless steel manufactured to ASTM A240 / A240M - 95a designation S30400 or EN 10088 grade 1.4301 without a post treatment | |
| 9B | Stainless steel manufactured to ASTM A240 / A240M - 95a designation S31603 or EN 10088 grade 1.4404 without a post treatment | |
| 9C | Stainless steel manufactured to ASTM A240 / A240M - 95a designation S30400 or EN 10088 grade 1.4301 with a post treatment | |
| 9D | Stainless steel manufactured to ASTM A240 / A240M - 95a designation S31603 or EN 10088 grade 1.4404 with a post treatment |  |

4.2.1 Materials

The following materials are used in the manufacture of the Vantrunk Cable Management Systems, components and accessories:

Structural Steels with Enhanced Suitability for Galvanising

Where it is beneficial Vantrunk products are manufactured using grades of structural steel that have a guaranteed minimum level of silicon, thereby increasing the zinc coating thickness and extending the time to first maintenance.

Structural Steel to BS EN 10025-2

Vantrunk's GY structural steel is a weldable, high strength structural steel with good galvanising properties. Products manufactured from this grade of steel have a minimum average zinc coating of 85 microns.

Structural Steel to BS EN 10025-2

Vantrunk's GW structural steel is a weldable, extreme strength structural steel with excellent galvanising properties. Products manufactured from this grade of steel have a minimum average zinc coating of 120 microns.

Silicon Rich Structural Steel to BS EN 10025-5

Vantrunk's GX silicon rich structural steel is a weldable, extreme strength structural steel suitable for deep galvanising. Ideal for environments where excellent corrosion resistance is required. A particular property of this material is the high silicon content which gives an affinity to attract even thicker coatings of zinc when galvanised (see Finishes – Deep Galvanising). Products manufactured from this grade of steel can achieve a minimum average zinc coating of up to 160 microns.

Mechanical Properties of Structural Steels with Enhanced Suitability for Galvanising

| Material | Property | | |
|---|-------------------------------------|---------------------------------------|---------------|
| | Yield Strength (N/mm ²) | Tensile Strength (N/mm ²) | Elongated A % |
|  | 275 minimum | 430 - 580 | 15 |
|  | 355 minimum | 510 - 680 | 15 |
|  | 355 minimum | 510 - 680 | 15 |

Low Carbon Steel

Vantrunk Cable Management Systems are manufactured using two different types of low carbon steel, each of which is matched for performance and strength to the product and the intended application. These low carbon steel materials are hot-rolled steel and cold-rolled steel.

Hot-rolled Low carbon Steel to BS EN 10111

Hot-rolled low carbon steel is a cold forming material used for bending and drawing applications. This material is suitable for welding and hot dip galvanizing.

Cold-rolled Low Carbon Steel to BS EN 10130

Cold-rolled steel grade is a cold-forming material for forming and deep drawing applications. This material is suitable for welding and hot dip galvanizing.

The minimum average zinc coating thickness on the GA type materials is gauge dependant and in accordance with BS EN 1460.

Mechanical Properties of Low Carbon Steel

| Material Grade | Type | Property | | |
|---|-------------|---|--|---------------|
| | | Yield Strength ReH (N/mm ²) | Tensile Strength Rm (N/mm ²) | Elongated A % |
|  | Hot Rolled | 170 – 360 | 440 | 23 |
| | Cold Rolled | 280 maximum | 270 – 410 | 28 |

Stainless Steel

The Speedway Cable Ladder System, components and accessories are manufactured using 1.4404 marine grade stainless steel (316) which is matched for performance and strength to the product and the intended application.

The corrosion resistance of stainless steel arises from a passive, chromium-rich, oxide film that forms naturally on the surface of the steel. Although extremely thin at 1.5 nanometres (i.e. 1.5×10^{-9} metres) thick, this protective film is strongly adherent, and chemically stable (i.e. passive) under conditions which provide sufficient oxygen to the surface. The key to the durability of the corrosion resistance of stainless steels is that if the film is damaged it will normally self-repair in the presence of oxygen. In contrast to mild steel type materials which suffer from general corrosion where large areas of the surface are affected, stainless steels which have a passive oxide film are normally resistant to general corrosion. Stainless steels should not be considered to be indestructible, the oxide film can be broken down under certain conditions and corrosion can result, this typically taking the form of pitting or crevice corrosion.

The stainless steel used in the manufacture of Vantrunk Cable Management Systems, components and accessories has excellent corrosion and oxidation resistance due to the high chromium content. Grades 1.4404 stainless steel is an austenitic stainless steel which incorporate nickel to strengthen the oxide film and improve performance in more aggressive environments. The addition of molybdenum to 1.4404 marine grade improves resistance to pitting corrosion. The austenitic stainless steels have excellent resistance to attack by acids, alkalis and other chemicals.

Stainless steels offer excellent performance at both high and low temperatures and, unlike some mild steels, are not susceptible to brittle fracture arising from impact at low temperature. Independent tests have shown that stainless steel cable ladders and trays can withstand a temperature of 1000°C for a period of 5 minutes without collapse (contact our Technical Team for further details).

As the corrosion resistance of stainless steel is derived from the self-repairing oxide film it is important that the surface of the stainless steel remains uncontaminated, allowing the inherent corrosion resistance of the stainless steel to be maintained. Possible sources of contamination includes mild steel from cutting and drilling operations on site, and impingement of small particles created by welding and grinding of mild steel in close proximity to the stainless steel product. Care must be taken both during and after installation to avoid such contamination.

Stainless Steel Grade 1.4404 (316L) to BS EN 10088-2

Marine grade 1.4404 stainless steel is a corrosion resistant steel ideally suited for aggressive environments where severe conditions are prevalent, i.e. coastal and offshore applications. 1.4404 is a molybdenum-bearing austenitic stainless steel with high corrosion resistant properties, particularly to pitting and crevice corrosion. 1.4404 has excellent forming and welding characteristics. Post-weld annealing is not required with welding the material gauges that are used in the manufacture of the Speedway Cable Ladder System.

Mechanical Properties of Stainless Steel

| Material Grade | Property | | |
|---|---|---|--------------------------------|
| | Proof Strength 0.2% Rp0.2 (N/mm ²) | Tensile Strength Rm (N/mm ²) | Elongated A ₈₀ % |
|  | 240 Min | 530 to 680 | 40 |

4.2.2 Finishes

The following are available for Vantrunk Cable Management Systems, components, and accessories:

Galvanising

Hot dip galvanised to BS EN ISO 1461
(post-galvanised) GY, GA, & GW
Deep Galvanised to BS EN ISO 1461
(post-galvanised) GX & GW

Coatings

Epoxy coated over low carbon steel EY & EA
Epoxy coated over hot dip galvanising FY & FA

Galvanising

The coating of steel using zinc, either before manufacture (pre-galvanised) or after manufacture (post-galvanised) is a cost effective and practical means of protecting the steel from corrosion. The zinc coating protects the steel in three ways. Firstly, the zinc coating weathers at a very slow rate giving a long and predictable life. Secondly, the zinc coating corrodes preferentially to provide sacrificial protection of any small areas of steel exposed through cutting, drilling, or accidental damage; scratches and small areas of damage are sealed by weathering products from the zinc. Thirdly, if the damaged area is larger, the sacrificial protection provided by the surrounding zinc prevents 'creepage' typically associated with other protective finishes such as paint coatings.

The thickness of the zinc coating is dependant on the method of application. The following table shows the typical zinc coating thicknesses for a number of galvanising and related processes, and includes zinc based paints for comparison purposes.

Zinc coatings compared in terms of coating thickness

Hot Dip Galvanised Finishes to BS EN ISO 1461

The hot dip galvanising process provides a continuous layer of zinc-iron alloys and zinc on the surface of the products manufactured in steel. The hot dip zinc coating provides a continuous barrier to moisture and other contaminants, thereby protecting the steel substrate.

During the galvanising process, a layer of zinc-iron alloy develops on the surface of the steel product. When the steel product is withdrawn from the zinc bath, a layer of pure zinc is left on the zinc-iron alloy. The layer of pure zinc gives a newly galvanised item a bright finish. This bright finish will gradually fade as the surface layer of the zinc oxidises, leaving a uniform dull grey appearance.

The average amount of zinc which can be deposited on a product is expressed in terms of thickness and is measured in µm. The actual zinc coating thicknesses will vary depending on the thickness of the steel, the chemical composition of the steel, and the period of immersion within the zinc bath. BS EN ISO 1461 specifies a number of thickness ranges for products to be galvanised, each of which has a specified minimum average local reading and minimum mean average reading. Details are given in the following table.

Zinc Coating Details to BS EN ISO 1461

| Coating Weight & Thickness – Dipped Articles | | | | |
|--|--------------------------|-------------------------|--------------------------|-------------------------|
| Article & Thickness | Local Coating | | Mean Coating | |
| | (minimum) | | (minimum) | |
| | Mass (g/m ²) | Thickness μm | Mass (g/m ²) | Thickness μm |
| Steel $t \geq 6\text{mm}$ | 505 | 70 | 610 | 85 |
| Steel $3\text{mm} \geq t < 6\text{mm}$ | 395 | 55 | 505 | 70 |
| Steel $1.5\text{mm} \geq t < 3\text{mm}$ | 325 | 45 | 395 | 55 |
| Steel $t < 1.5\text{mm}$ | 250 | 35 | 325 | 45 |
| Castings $t \geq 6\text{mm}$ | 505 | 70 | 575 | 80 |
| Castings $t < 6\text{mm}$ | 430 | 60 | 505 | 70 |

| Coating Weight & Thickness – Centrifuged Articles | | | | |
|---|--------------------------|-------------------------|--------------------------|-------------------------|
| Article & it's Thickness | Local Coating | | Mean Coating | |
| | (minimum) | | (minimum) | |
| | Mass (g/m ²) | Thickness μm | Mass (g/m ²) | Thickness μm |
| Articles with threads: | | | | |
| Diameter $\geq 6\text{mm}$ | 395 | 55 | 505 | 70 |
| Diameter $\leq 6\text{mm}$ | 325 | 45 | 395 | 55 |
| Other articles (including castings): | | | | |
| $t \geq 3\text{mm}$ | 325 | 45 | 395 | 55 |
| $t < 3\text{mm}$ | 250 | 35 | 325 | 45 |

Deep Galvanising to BS EN ISO 1461

The use of silicon-rich steels allows much heavier galvanised coatings to be obtained. Average coating thicknesses of two to three times that for low carbon steel can be achieved. It is for this reason that silicon-rich steels are termed 'reactive' steels and the galvanising process 'deep galvanising'.

The influence of the silicon does not increase consistently but rather follows a curve as shown in the following diagram. This curve gives average values and variations can be expected between different silicon-rich steels with the same silicon content but from different steel casts.

These variations are attributed to the fact that whilst the total silicon contents can be equal, the amount of silicon that is bound to oxygen within the steel can vary. More or less silicon is then dissolved in the steel, and it is only this amount that influences the reaction. The silicon can be unevenly distributed on the surface of the steel and this will lead to uneven variations in the coating thickness after galvanising.

Another property of the galvanised coatings on silicon-rich steels is the colour. During the galvanising process, a zinc layer builds up on the zinc-iron alloy layers which are adhering to the surface of the steel. The reaction rate can be such that this pure zinc layer is transformed completely to zinc-iron alloy before the article has had time to cool.

This results in a coating which can be much darker in appearance, varying in colour and thickness across the surface of the galvanised item. This appearance does not alter the corrosion resistance of the zinc coating. Due to the variations in coating thickness associated with deep galvanising of silicon-rich materials it is normal to specify the finish as 'deep galvanised to twice the coating thickness specified by BS EN ISO 1461'.

Wet storage stain

Galvanised steel is protected from corrosion by a layer of zinc-iron alloys and a layer of pure zinc. After galvanising, a protective zinc carbonate film forms over the surface of the zinc. The formation of this protective layer is only possible when the galvanised surface is exposed to free flowing air. Stacking freshly galvanised articles in contact with one another prevents the free circulation of air, and in wet or humid conditions, may result in the development of wet storage stain. Wet storage stain, often referred to as white rust, appears as a white, powdery covering. The white rust, comprising of zinc oxide and zinc hydroxide corrosion products, is voluminous and can appear to be more detrimental to the galvanised coating than it actually is.

Wet storage stain can be prevented by correct transport and storage provisions. For transportation over long distances, galvanised items should be protected by waterproof cover to prevent moisture ingress. For storage, galvanised items should be kept off the ground in a dry environment. If stacked in a potentially wet environment, the galvanised items should be separated from one another to provide free circulation of air. If possible, the stacking should be at an angle to facilitate drainage of water.

In normal use, light wet storage stain is not serious and does not reduce the life expectancy of the galvanised coating. The affected area should be dried and exposed to the atmosphere to allow the zinc to form a protective carbonate layer. The appearance of the wet storage stain will gradually fade to that of a normally weathered galvanised steel. Where more stubborn wet storage stain deposits are evident, these should be removed using a stiff bristle (non wire) brush and, if necessary, a cleaning solution should be used. Typical solutions would be ammonia or a citric acid based clear such as Metsoak C4900 with a 10% dilution v/v, the cleaning solutions should be thoroughly rinsed off after treatment and the article allowed to dry.

Life expectancy of zinc coatings

The life expectancy of a zinc coating is largely determined by its thickness. Thicker coatings give longer life (the period to first maintenance). When exposed to atmosphere the zinc coating will weather and corrode, leading to a gradual diminution in the coating thickness. Under conditions of normal atmospheric exposure the level of corrosion is low and is typically at a rate which is between 1/10th and 1/40th of that of the steel base.

When subject to conditions of high humidity or condensation, the rate of corrosion of the zinc coating can be increased significantly.

The level of contamination in the atmosphere can also adversely affect the corrosion rate of the zinc coating. The most significant contaminant accelerating the corrosion rate of zinc is sulphur dioxide (SO₂). The resistance of zinc to atmospheric corrosion is dependent on the protective zinc carbonate film which forms on the surface of the zinc.

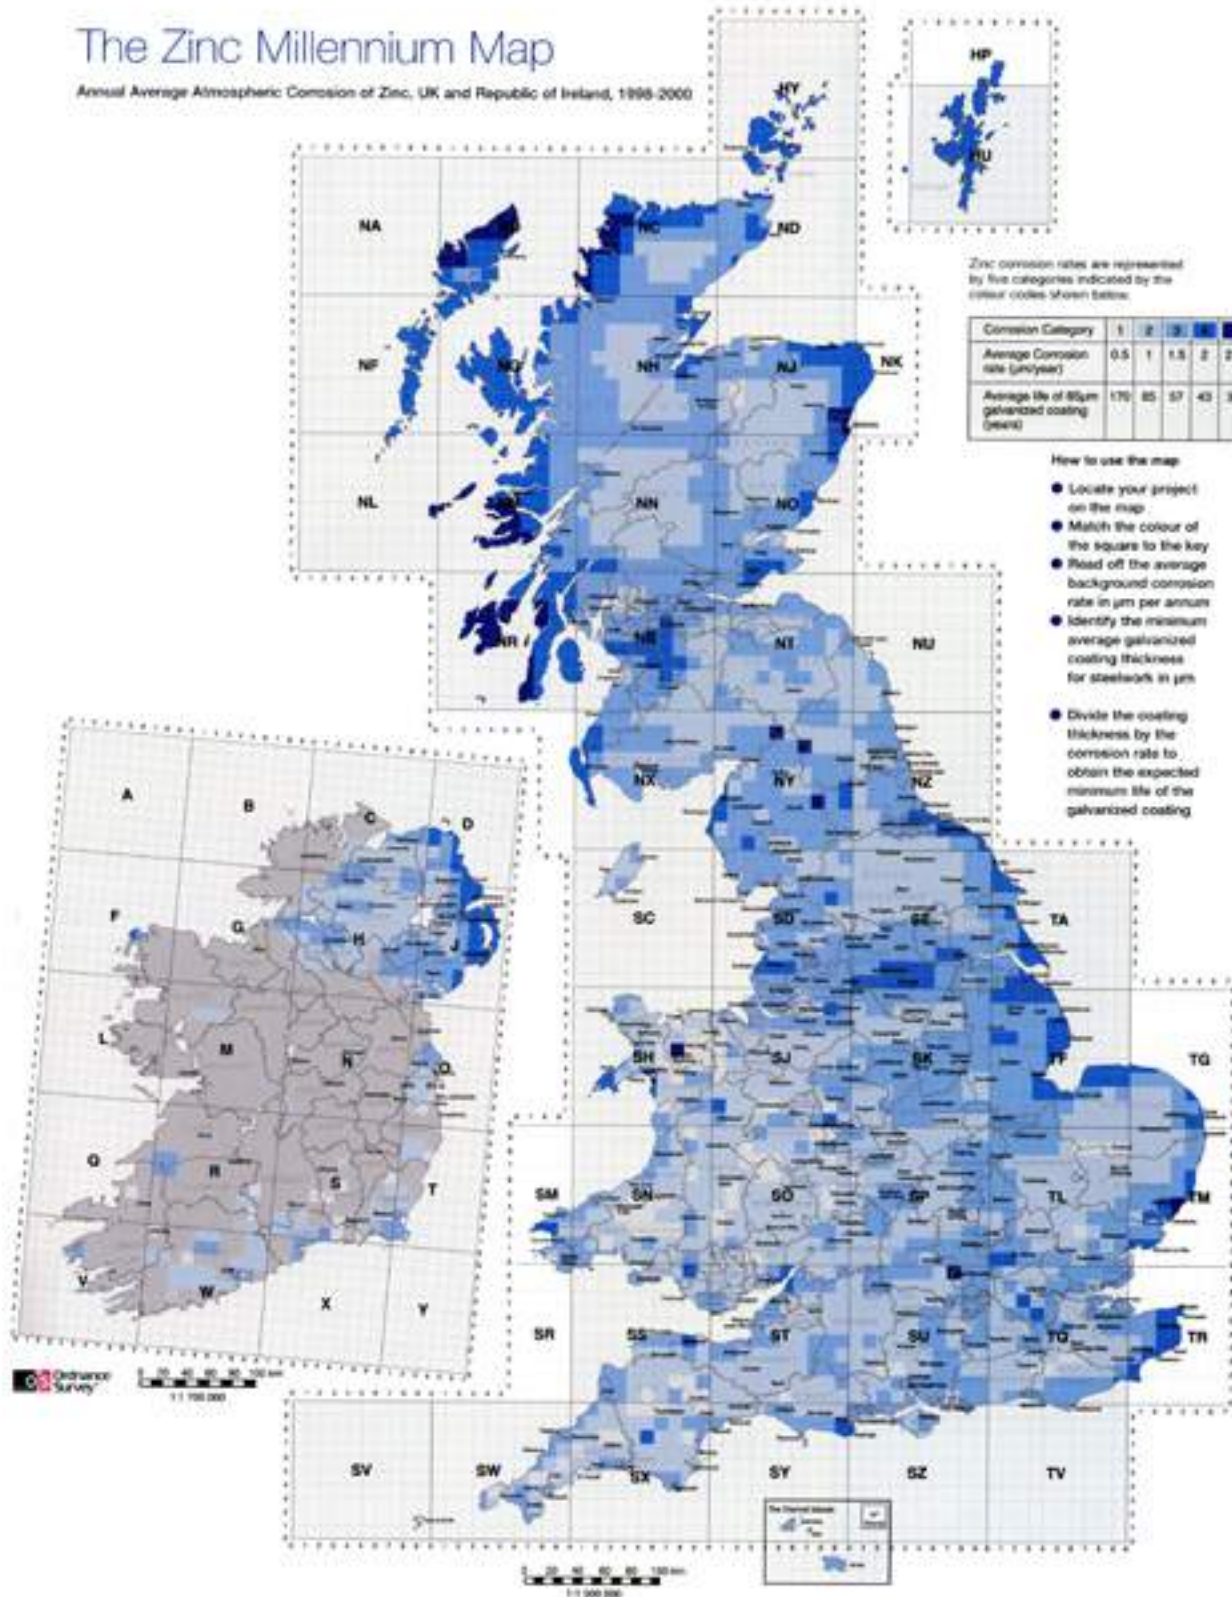

The sulphur dioxide reacts with moisture to destroy the protective film and this leads to the corrosion of the zinc coating.

Research undertaken by the Galvanizers Association has resulted in the publishing of a series of charts depicting the average atmospheric corrosion rate for zinc for the United Kingdom and Ireland. These charts indicate that the average local atmospheric corrosion rates for zinc have decreased, reflecting the general decrease in the levels of sulphur dioxide in the atmosphere.

Current atmospheric corrosion rates for zinc within the United Kingdom and the Republic of Ireland are given in the Zinc Millennium Map and are in the range of 0.5µm to 2.5µm per year (corrosion categories C2 – C3 to ISO 14713). Please see the following page for the Zinc Millennium Map.

The Zinc Millennium Map

Annual Average Atmospheric Corrosion of Zinc, UK and Republic of Ireland, 1998-2000

The corrosion rate for zinc is generally linear for a given local environment. This allows predictions of the life expectancy of a galvanised product, to first maintenance, based on the zinc coating thickness and the zinc corrosion rates given in the Zinc Millennium Map. For example, a hot dip galvanised product with a coating thickness of 55µm will last approximately 110 years in a location where the atmospheric corrosion rate of zinc is 0.5µm per year, and approximately 22 years in a location where the atmospheric corrosion rate is 2.5µm per year.

Further information regarding hot dip galvanising and the Zinc Millennium Map can be obtained from the Galvanizers Association. The Zinc Millennium Map provides specific information for the United Kingdom and Ireland. For other locations, reference can be made to BS EN ISO 14713 (Protection against corrosion of iron and steel in structures – Zinc and aluminium coatings – Guidelines).

BS EN ISO 14713 provides general guidelines on corrosion rates for zinc in differing environmental conditions, details of which are given in the table below.

| Category | Corrosion Rate µm/year | Environment | | 0 | 20 | 40 | 60 | 80 | 100 | 120 | 140 | 160 | 180 | 200 | 300 | 400 | 500 |
|---|-------------------------------|-------------|--|---|----|----|----|----|-----|-----|-----|---|-----|-----|-----|-----|-----|
| C2 | 0.1 < rate ≤ 0.7 Low | Indoor | • Unheated spaces with varying temperature and relative humidity. Low frequency of condensation and low pollution, e.g. storage, sport halls | | | | | | | | | | | | | | |
| | | Outdoor | • Temperate zone, atmospheric environment with low pollution, e.g.: rural areas, small towns • Dry or cold zone, atmospheric environment with short time of wetness, e.g. deserts, sub-arctic areas | | | | | | | | | | | | | | |
| C3 | 0.7 < rate ≤ 2.1 Medium | Indoor | • Spaces with moderate frequency of condensation and moderate pollution from production process, e.g. food processing plants, laundries, breweries, dairies | | | | | | | | | | | | | | |
| | | Outdoor | • Temperate zone, atmospheric environment with medium pollution or some effect of chlorides, e.g. urban areas, coastal areas with low deposition of chlorides • Subtropical and tropical zones with atmosphere with low pollution | | | | | | | | | | | | | | |
| C4 | 2.1 < rate ≤ 4.2 High | Indoor | • Spaces with high frequency of condensation and high pollution from production process, e.g. industrial processing plants, swimming pools | | | | | | | | | | | | | | |
| | | Outdoor | • Temperate zone, atmospheric environment with high or substantial effect of chlorides, e.g. polluted urban areas, industrial areas, coastal areas without spray of salt water, exposure to strong effect of de-icing salts • Subtropical and tropical zones with atmosphere with medium pollution | | | | | | | | | | | | | | |
| C5 | 4.2 < rate ≤ 8.4 Very High | Indoor | • Spaces with very high frequency of condensation and/or with high pollution from production process, e.g. mines, caverns for industrial purposes, unventilated sheds in subtropical and tropical zones | | | | | | | | | | | | | | |
| | | Outdoor | • Temperate and Subtropical zones, atmospheric environment with very high pollution and/or important effect of chlorides, e.g. industrial areas, coastal areas, sheltered positions on coastline | | | | | | | | | | | | | | |
| CX | 8.4 < rate ≤ 25 Extreme | Indoor | • Spaces with almost permanent condensation or extensive periods of exposure to extreme humidity effects and/or with high pollution from production process, e.g. unventilated sheds in humid tropical zones with penetration of outdoor pollution including airborne chlorides and corrosion-stimulating particulate matter | | | | | | | | | | | | | | |
| | | Outdoor | • Subtropical and Tropical zones (very high time of wetness), atmospheric environment with very high pollution, including accompanying and production pollution and/or strong effect of chlorides, e.g. extreme industrial areas, coastal and offshore areas with occasional contact with salt spray | | | | | | | | | | | | | | |
| Low carbon Steel to BS EN ISO 1461 55µ Coating Thickness | | | | Silicon Rich Steel to BS EN ISO1461 140µ Coating Thickness | | | | | | | | Pre-Galvanised Steel to BS EN ISO 10326 19-25µ Coating Thickness | | | | | |

The corrosion rates should be considered as an indication only and provide a broad means of estimating the life expectancy of a zinc coating. This information should be treated as a general guide and further information should be sought relating to the specific zinc corrosion rates at the installation site. Using these broad corrosion rates, the above table shows the life expectancy of galvanised cable management products for corrosion categories C2 to CX.

Pickling and Passivation

Stainless steel is corrosion resistant because of the presence of a thin, dense, self-healing passive chromium-rich layer on the surface of the metal. This protective layer acts as a barrier between the metal and the environment and reduces the rate of dissolution of the metal. If this chromium oxide film is damaged the steel will, in most circumstances, oxidise and reform the protective layer (self-healing). When the surface of stainless steel is subject to mechanical treatments such as grinding or machining stresses, an increased roughness will occur in the outer surface layers damaging the oxide film, occasionally leaving impurities on the surface and preventing the passive film from reforming. This can also happen in general handling.

In addition, many grades of stainless steel are adversely affected by processes such as welding or heat treatment which can result in the formation of surface oxide films which can prevent the natural passive chromium oxide layer from forming. The heat discolouration marks found around the welds of stainless steel products is a form of oxide which does not necessarily adversely influence corrosion resistance unless the material is exposed to the most extremely aggressive environments e.g. when used for acid containment, etc. It should not be necessary to remove this discolouration in situations where the stainless steel offers satisfactory corrosion resistance for a particular installation.

If the passive oxide layer is damaged and the self-healing process does not occur the stainless steel will corrode, this will take the form of pitting, intercrystalline corrosion, or stress corrosion cracking. The rate of corrosion is accelerated in the presence of chloride compounds. Consequently, it is important to specify the correct grade of stainless steel, to use the correct welding techniques, and to avoid contamination with carbon steel during manufacturing processes. The use of 1.4404 marine grade stainless steel (316 grade) reduces the potential corrosion problems associated with the welding of stainless steel.

As standard, stainless steel Speedway Cable Ladder is treated by means of pickling and passivating. The pickling process removes the surface of the stainless steel by etching in a heated nitric/hydrofluoric acid solution. Pickling will remove surface debris, leaving the stainless steel clean and allowing the passive chromium oxide film to form; the surface of the stainless steel can then be described as being in the passive condition. A further treatment is then applied in which a solution of nitric acid is used to thicken the existing passive layer of chromium oxide whilst reducing the time taken to form the film. The entire process leaves the stainless steel with a uniform dull grey colour.

Coatings

A number of coatings have been used for the coating of cable management products. By far the most cost effective, versatile, and advantageous is epoxy. Epoxy coatings are based on thermosetting epoxy resins which are applied electrostatically as a powder spray which is cured and hardened in an oven. The powder spray application ensures complete and even coverage of the surface. Epoxy coatings give a thin, hard and durable finish which provides good chemical resistance, excellent adhesion, and coating flexibility. Epoxy coatings are available in a variety of colours. Black is supplied as standard unless otherwise requested.

Epoxy over Low Carbon Steel

Epoxy coatings can be applied directly to low carbon steel to give a corrosion resistant finish. The steel products are subject to a degreasing treatment to remove all surface contaminants and then epoxy powder coated to a dry film thickness of 75 microns.

Epoxy over Hot Dip Galvanised Low Carbon Steel

Whilst hot dip galvanising provides a long lasting and cost effective means of protecting steel from corrosion, the performance of the zinc coating can be enhanced by the addition of an epoxy coating. This type of finish is referred to as a duplex coating. The duplex coating can be used to add colour for aesthetic or safety purposes and provide additional protection for the steel in aggressive environments. The epoxy provides resistance to chemical degradation, and the underlying layer of zinc prevents creepage under the epoxy coating. The hot dip galvanised steel products are treated by an acid etch, a chromate pre-treatment and then epoxy powder coated to a dry film thickness of 75 microns.

4.3 Declarations in accordance to BS EN IEC 61537

As part of BS EN IEC 61537, Cable tray systems and cable ladder systems for cable management, Vantrunk supply the following information that is necessary for the proper and safe installation and use of Cable Management Systems:

- a) **Installation / Assembly Instruction:**
 - i. For **Speedway** see Page 215
 - ii. For **Cable Tray** see Page 231
- b) **Thermal Expansion:** See Page 245
- c) **Classification:**

| Clause | SS | GY | GA | GX | GW |
|---|--|---------------|---------------|---------------|---------------|
| 6.1 According to material | 6.1.1 Metallic system component | | | | |
| 6.2 According to resistance to flame propagation | 6.2.2 Non-flame propagating system component | | | | |
| 6.3 According to electrical continuity characteristics | 6.3.2 Cable ladder system with electrical continuity characteristics | | | | |
| 6.4 According to electrical conductivity | 6.4.1 Electrically conductive system component | | | | |
| 6.5 According to resistance against corrosion | 6.5.2 Class 9D | 6.5.2 Class 8 | 6.5.2 Class 6 | 6.5.2 Class 8 | 6.5.2 Class 8 |
| 6.6 According to Temperature | | | | | |
| 6.6.1 Minimum temperature for the system component | -50°C | -20°C | -20°C | -50°C | -40°C |
| 6.6.2 Maximum temperature for the system component | +150°C | +150°C | +150°C | +150°C | +150°C |
| 6.7 According to the perforation in the base area of the cable tray | Classification B: Over 2% and up to 15% | | | | |
| 6.8 According to the free base area of cable ladder length | Classification Y: Over 80% and up to 90% | | | | |
| 6.9 According to impact resistance | 6.9.5 System component offering impact resistance up to 50 J | | | | |

- d) **Relative Humidity:** Humidity does not affect classification
- e) **Equipotential Bonding:**
 - i. For **Speedway** see Page 221
 - ii. For **Cable Tray** see Page 235
- f) **Transport and Storage Precautions:** Materials can be used to temperature limits shown within the Product Guide without taking any precautions (7.2)
- g) **Product Dimensions:**
 - i. For **Speedway** see Page 32
 - ii. For **Cable Tray** see Page 101
- h) **Torque Settings:**
 - i. For **Speedway** see Page 222
 - ii. For **Cable Tray** see Page 236
- i) **End Span Limitations:** See Page 216
- j) **Position and type of coupling along the span:** See Page 216
- k) **Fittings Support Recommendations:**
 - i. For **Speedway** see Page 217
 - ii. For **Cable Tray** see Page 232
- l) **Test Fixing Method:** Not fixed to supports
- m) **Straight Length Safe Working Load:**
 - i. For **Speedway** load data see Page 225
 - ii. For **Cable Tray** load data see Page 239
- n) **Cantilever Safe Working Load :**
 - i. For **Speedway** cantilevers see Page 89
 - ii. For **Cable Tray** cantilevers see Page 140
 - iii. For **Intelok** cantilevers see Page 173 & 175
- o) **Pendant Safe Working Load:** Not applicable.
- p) **Material Specification:** See Page 252

For details relating to the CE marking of the Speedway Cable Ladder System and Vantrunk Cable Tray System, the associated Declaration and Technical File, please refer to our Technical Team.

4.4 Reference Standards

The following is a list of the standards relating to the cable management products covered by this catalogue:

| | | | |
|----------------|---|-----------------|--|
| BS 729 | Replaced by BS EN ISO 1461. | BS EN 10130 | Cold rolled low carbon flat products for cold forming. Technical delivery conditions. |
| BS 1449 Part 1 | Replaced by BS EN 10111, 10130 & 10025. | BS EN 10147 | Replaced by BS EN 10136:2004. |
| BS 1449 Part 2 | Replaced by BS EN 10088-2. | BS EN 10326 | Continuously hot-dip coated strip and sheet of structural steels. Technical delivery conditions. |
| BS EN ISO 1461 | Hot dip galvanised coatings on fabricated iron and steel articles. Specifications and test methods (formerly BS 729). | BS EN ISO 14713 | Protection against corrosion of iron and steel in structures – Zinc and aluminium coatings – Guidelines. |
| BS 2989 | Replaced by BS EN 10147. | BS EN 10327 | Continuously hot dip coated strip & sheet of low carbon steels for cold forming. Technical delivery conditions. |
| BS 6946 | Specification for metal channel cable support systems for electrical installations. | BS EN 50085-1 | Cable trunking and cable ducting systems for electrical installations. General requirements (formerly BS 4678 Part 1). |
| ISO 9223 | Corrosion of metals & alloys – Corrosivity of atmospheres. | BS EN IEC 61537 | Cable tray systems & cable ladder systems for cable management. |
| BS EN 10025 | Replaced by BS EN 10025-2 | NEMA VE 1 | Metal Cable Tray Systems (also CSA International C22.2 No 126.1-98). |
| BS EN 10025-2 | Hot rolled products of structural steels. Technical delivery conditions for nonalloy structural steels (formerly BS EN 10025:1993). | NEMA VE 2 | Cable Tray Installation Guidelines. |
| BS EN 10088-2 | Stainless steels. Technical delivery conditions for sheet/plate and strip for general purposes (formerly BS 1449 Part 2). | BS EN 10346 | Continuously hot-dip coated strip & sheet of low carbon steels for cold forming. Technical delivery conditions. |
| BS EN 10111 | Continuously hot rolled low carbon steel sheet & strip for cold forming. Technical delivery conditions. | | |
